SCR

C140(2N3649-53)

C141(2N3654-58)

C140 and C141 Series of Silicon Controlled Rectifiers are reverse blocking triode thyristor semiconductor devices designed primarily for high-frequency power switching applications which require blocking voltages up to 400 volts and load currents up to 35 amperes RMS, at frequencies up to 25 kHz.

For line commutated applications (phase control, AC switching) at power line frequencies, up to 35 amperes RMS, the following preferred SCR types are recommended: C35 (Pub. #160.20), and C137 (Pub. #160.45).

The C140 and C141 Series feature:

- Contoured junction surfaces for high-voltage stability
- Shorted emitters for high dv/dt ($200V/\mu\text{sec}$)
- Distributed gates for high di/dt ($400A/\mu\text{sec}$)

Equipment designers can use the C140 and C141 SCR's in demanding applications such as:

- Choppers
- Inverters
- Regulated power supplies
- Cycloconverters
- Ultrasonic generators
- High frequency lighting
- Sonar transmitters
- Induction heaters
- Radio transmitters

This specification sheet uses a simplified and easy-to-use rating system which graphically presents:

- Case Temperature
- Peak Anode Current
- dv/dt and Turn-off Times

for rectangular and sinusoidal anode-current waveforms
