## 8-bit synchronous BCD down counter

## 74HC/HCT40102

## FEATURES

- Cascadable
- Synchronous or asynchronous preset
- Output capability: standard
- $I_{CC}$  category: MSI

## GENERAL DESCRIPTION

The 74HC/HCT40102 are high-speed Si-gate CMOS devices and are pin compatible with the "40102" of the "4000B" series. They are specified in compliance with JEDEC standard no. 7A.

The 74HC/HCT40102 consist each of an 8-bit synchronous down counter with a single output which is active when the internal count is zero. The "40102" is configured as two cascaded 4-bit BCD counters and has control inputs for enabling or disabling the clock (CP), for clearing the counter to its maximum count, and for presetting the counter either synchronously or asynchronously. All control inputs and the terminal count output ( $\overline{TC}$ ) are active-LOW logic.

In normal operation, the counter is decremented by one count on each positive-going transition of the clock (CP). Counting is inhibited when the terminal enable input ( $\overline{TE}$ ) is HIGH. The terminal count output ( $\overline{TC}$ ) goes LOW when the count reaches zero if  $\overline{TE}$  is LOW, and remains LOW for one full clock period.

## QUICK REFERENCE DATA

GND = 0 V;  $T_{amb} = 25\text{ }^{\circ}\text{C}$ ;  $t_r = t_f = 6\text{ ns}$

SYMBOL	PARAMETER	CONDITIONS	TYPICAL		UNIT
			HC	HCT	
$t_{PHL}/t_{PLH}$	propagation delay CP to $\overline{TC}$	$C_L = 15\text{ pF}$ ; $V_{CC} = 5\text{ V}$	30	31	ns
$f_{max}$	maximum clock frequency		30	30	MHz
$C_I$	input capacitance		3.5	3.5	pF
$C_{PD}$	power dissipation capacitance per package	notes 1 and 2	20	25	pF

## Notes

1.  $C_{PD}$  is used to determine the dynamic power dissipation ( $P_D$  in  $\mu\text{W}$ ):

$$P_D = C_{PD} \times V_{CC}^2 \times f_i + \sum (C_L \times V_{CC}^2 \times f_o) \text{ where:}$$

$f_i$  = input frequency in MHz

$f_o$  = output frequency in MHz

$\sum (C_L \times V_{CC}^2 \times f_o)$  = sum of outputs

$C_L$  = output load capacitance in pF

$V_{CC}$  = supply voltage in V

When the synchronous preset enable input ( $\overline{PE}$ ) is LOW, data at the jam input ( $P_0$  to  $P_7$ ) is clocked into the counter on the next positive-going clock transition regardless of the state of  $\overline{TE}$ . When the asynchronous preset enable input ( $\overline{PL}$ ) is LOW, data at the jam input ( $P_0$  to  $P_7$ ) is asynchronously forced into the counter regardless of the state of  $\overline{PE}$ ,  $\overline{TE}$ , or CP. The jam inputs ( $P_0$  to  $P_7$ ) represent two 4-bit BCD words.

When the master reset input ( $\overline{MR}$ ) is LOW, the counter is asynchronously cleared to its maximum count (decimal 99) regardless of the state of any other input. The precedence relationship between control inputs is indicated in the function table.

If all control inputs except  $\overline{TE}$  are HIGH at the time of zero count, the counters will jump to the maximum count, giving a counting sequence of 100 clock pulses long. The "40102" may be cascaded using the  $\overline{TE}$  input and the  $\overline{TC}$  output, in either a synchronous or ripple mode.

## APPLICATIONS

- Divide-by-n counters
- Programmable timers
- Interrupt timers
- Cycle/program counters

# 8-bit synchronous BCD down counter

# 74HC/HCT40102

- 2. For HC the condition is  $V_I = \text{GND to } V_{CC}$   
 For HCT the condition is  $V_I = \text{GND to } V_{CC} - 1.5 \text{ V}$

### ORDERING INFORMATION

See "74HC/HCT/HCU/HCMOS Logic Package Information".

### PIN DESCRIPTION

PIN NO.	SYMBOL	NAME AND FUNCTION
1	CP	clock input (LOW-to-HIGH, edge-triggered)
2	$\overline{\text{MR}}$	asynchronous master reset input (active LOW)
3	$\overline{\text{TE}}$	terminal enable input
4, 5, 6, 7, 10, 11, 12, 13	$P_0$ to $P_7$	jam inputs
8	GND	ground (0 V)
9	$\overline{\text{PL}}$	asynchronous preset enable input (active LOW)
14	$\overline{\text{TC}}$	terminal count output (active LOW)
15	$\overline{\text{PE}}$	synchronous preset enable input (active LOW)
16	$V_{CC}$	positive supply voltage

8-bit synchronous BCD down counter

74HC/HCT40102

Fig.4 Functional diagram.

FUNCTION TABLE

CONTROL INPUTS				PRESET MODE	ACTION
$\overline{MR}$	$\overline{PL}$	$\overline{PE}$	$\overline{TE}$		
H	H	H	H	synchronous	inhibit counter
H	H	H	L		count down
H	H	L	X		preset on next LOW-to HIGH clock transition
H	L	X	X	asynchronous	preset asynchronously
L	X	X	X		clear to maximum count

Notes

1. Clock connected to CP.
2. Synchronous operation: changes occur on the LOW-to-HIGH CP transition.
3. Jam inputs: MSD = P<sub>7</sub>, LSD = P<sub>0</sub>.

H = HIGH voltage level  
 L = LOW voltage level  
 X = don't care

## 8-bit synchronous BCD down counter

74HC/HCT40102

**DC CHARACTERISTICS FOR 74HCT**

For the DC characteristics see *"74HC/HCT/HCU/HCMOS Logic Family Specifications"*.

Output capability: standard

I<sub>CC</sub> category: MSI

**Note to HCT types**

The value of additional quiescent supply current ( $\Delta I_{CC}$ ) for a unit load of 1 is given in the family specifications.

To determine  $\Delta I_{CC}$  per input, multiply this value by the unit load coefficient shown in the table below.

INPUT	UNIT LOAD COEFFICIENT
CP, $\overline{PE}$	1.50
$\overline{MR}$	1.00
$\overline{TE}$	0.80
P <sub>n</sub>	0.25
$\overline{PL}$	0.35
