

A3G4250D

MEMS motion sensor: 3-axis digital output gyroscope

Features

- Wide supply voltage: 2.4 V to 3.6 V
- ± 245 dps full scale
- I²C/SPI digital output interface
- 16-bit rate value data output
- 8-bit temperature data output
- Two digital output lines (interrupt and data ready)
- Integrated low and high-pass filters with user-selectable bandwidth
- Ultra-stable over temperature and time
- Low-voltage-compatible IOs (1.8 V)
- Embedded power-down and sleep mode
- Embedded temperature sensor
- Embedded FIFO
- High shock survivability
- Extended operating temperature range (-40 °C to +85 °C)
- ECOPACK[®] RoHS and “Green” compliant
- AEC-Q100 qualification

Applications

- In-dash car navigation
- Telematics, e-Tolling
- Motion control with MMI (man-machine interface)
- Appliances and robotics

Description

The A3G4250D is a low-power 3-axis angular rate sensor able to provide unprecedented stability at zero rate level and sensitivity over temperature and time. It includes a sensing element and an IC interface capable of providing the measured angular rate to the external world through a standard SPI digital interface. An I²C-compatible interface is also available.

The sensing element is manufactured using a dedicated micro-machining process developed by STMicroelectronics to produce inertial sensors and actuators on silicon wafers.

The IC interface is manufactured using a CMOS process that allows a high level of integration to design a dedicated circuit which is trimmed to better match the sensing element characteristics.

The A3G4250D has a full scale of ± 245 dps and is capable of measuring rates with a user-selectable bandwidth.

The A3G4250D is available in a plastic land grid array (LGA) package and can operate within a temperature range of -40 °C to +85 °C.

Table 1. Device summary

| Order code | Temperature range (°C) | Package | Packing |
|------------|------------------------|-----------------------------------|---------------|
| A3G4250D | -40 to +85 | LGA-16 (4x4x1.1 mm ³) | Tray |
| A3G4250DTR | -40 to +85 | LGA-16 (4x4x1.1 mm ³) | Tape and reel |

| C2 | 470 nF |
| R2 | 10 k Ω |

2 Mechanical and electrical characteristics

2.1 Mechanical characteristics

@ Vdd = 3.0 V, T = -40... +85 °C, unless otherwise noted^(b).

Table 4. Mechanical characteristics

| Symbol | Parameter | Test condition | Min. | Typ. ⁽¹⁾ | Max. | Unit |
|--------|--|------------------------|--------------------|---------------------|---------------------|------------------|
| FS | Measurement range ⁽²⁾ | | | ±245 | | dps |
| So | Sensitivity ⁽³⁾ | | 7.4 | 8.75 | 10.1 | mdps/digit |
| SoDr | Sensitivity change vs. temperature | | | ±2 | | % |
| DVoff | Digital zero-rate level ⁽³⁾ | | -25 | | +25 | dps |
| OffDr | Zero-rate level change vs. temperature | | | ±0.03 | | dps/°C |
| NL | Non linearity ⁽²⁾ | Best fit straight line | -5 | 0.2 | +5 | % FS |
| DST | Self-test output change | | 55 | 130 | 245 | dps |
| Rn | Rate noise density | BW = 50 Hz | | 0.03 | 0.15 | dps/ sqrt(Hz) |
| ODR | Digital output data rate | | 89/176/ 357/714 | 105/208/ 420/840 | 121/239/ 483/966 | Hz |
| Top | Operating temperature range | | -40 | | +85 | °C |

1. Typical specifications are not guaranteed; typical values at +25 °C.
2. Guaranteed by design.
3. Across temperature and after MSL3 preconditioning.

b. The product is factory calibrated at 3.0 V. The operational power supply range is specified in [Table 5](#).

2.2 Electrical characteristics

@ Vdd = 3.0 V, T = -40... +85 °C, unless otherwise noted^(c).

Table 5. Electrical characteristics

| Symbol | Parameter | Test condition | Min. | Typ. ⁽¹⁾ | Max. | Unit |
|--------|--|---------------------------------|------|---------------------|---------|------|
| Vdd | Supply voltage | | 2.4 | 3.0 | 3.6 | V |
| Vdd_IO | I/O pins supply voltage ⁽²⁾ | | 1.71 | | Vdd+0.1 | V |
| Idd | Supply current | | 4.8 | 6.1 | 7.0 | mA |
| IddSL | Supply current in sleep mode ⁽³⁾ | Selectable by digital interface | | 1.5 | | mA |
| IddPdn | Supply current in power-down mode ⁽⁴⁾ | Selectable by digital interface | | 5 | 10 | μA |
| Top | Operating temperature range | | -40 | | +85 | °C |

1. Typical specifications are not guaranteed; typical values at +25 °C.
2. It is possible to remove Vdd maintaining Vdd_IO without blocking the communication busses, in this condition the measurement chain is powered off.
3. Sleep mode introduces a faster turn-on time compared to power-down mode.
4. Verified at wafer level.

2.3 Temperature sensor characteristics

@ Vdd = 3.0 V, T = 25 °C, unless otherwise noted^(d).

Table 6. Temp. sensor characteristics

| Symbol | Parameter | Test condition | Min. | Typ. ⁽¹⁾ | Max. | Unit |
|--------|--|----------------|------|---------------------|------|----------|
| TSDr | Temperature sensor output change vs. temperature | - | | -1 | | °C/digit |
| TODR | Temperature refresh rate | | | 1 | | Hz |
| Top | Operating temperature range | | -40 | | +85 | °C |

1. Typical specifications are not guaranteed; typical values at +25 °C.

c. The product is factory calibrated at 3.0 V.

d. The product is factory calibrated at 3.0 V.

2.4 Communication interface characteristics

2.4.1 SPI - serial peripheral interface

Subject to general operating conditions for Vdd and Top.

Table 7. SPI slave timing values

| Symbol | Parameter | Value ⁽¹⁾ | | Unit |
|----------|-------------------------|----------------------|------|------|
| | | Min. | Max. | |
| tc(SPC) | SPI clock cycle | 100 | | ns |
| fc(SPC) | SPI clock frequency | | 10 | MHz |
| tsu(CS) | CS setup time | 5 | | ns |
| th(CS) | CS hold time | 8 | | |
| tsu(SI) | SDI input setup time | 5 | | |
| th(SI) | SDI input hold time | 15 | | |
| tv(SO) | SDO valid output time | | 50 | |
| th(SO) | SDO output hold time | 6 | | |
| tdis(SO) | SDO output disable time | | 50 | |

1. Values are guaranteed at 10 MHz clock frequency for SPI with both 4 and 3 wires, based on characterization results; not tested in production.

Figure 4. SPI slave timing diagram^(e)

e. Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both input and output ports.

2.4.2 I²C - inter IC control interface

Subject to general operating conditions for Vdd and Top.

Table 8. I²C slave timing values

| Symbol | Parameter | I ² C standard mode ⁽¹⁾ | | I ² C fast mode ⁽¹⁾ | | Unit |
|-----------------------|--|---|------|---|------|------|
| | | Min. | Max. | Min. | Max. | |
| f _(SCL) | SCL clock frequency | 0 | 100 | 0 | 400 | kHz |
| t _{w(SCLL)} | SCL clock low time | 4.7 | | 1.3 | | μs |
| t _{w(SCLH)} | SCL clock high time | 4.0 | | 0.6 | | |
| t _{su(SDA)} | SDA setup time | 250 | | 100 | | ns |
| t _{h(SDA)} | SDA data hold time | 0 | 3.45 | 0 | 0.9 | μs |
| t _{h(ST)} | START condition hold time | 4 | | 0.6 | | μs |
| t _{su(SR)} | Repeated START condition setup time | 4.7 | | 0.6 | | |
| t _{su(SP)} | STOP condition setup time | 4 | | 0.6 | | |
| t _{w(SP:SR)} | Bus free time between STOP and START condition | 4.7 | | 1.3 | | |

1. Data based on standard I²C protocol requirement; not tested in production.

Figure 5. I²C slave timing diagram^(f)

f. Measurement points are done at 0.2·Vdd_IO and 0.8·Vdd_IO, for both ports.

2.5 Absolute maximum ratings

Any stress above that listed as “Absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 9. Absolute maximum ratings

| Symbol | Ratings | Maximum value | Unit |
|------------------|------------------------------------|---------------|----------|
| Vdd | Supply voltage | -0.3 to 4.8 | V |
| T _{STG} | Storage temperature range | -40 to +125 | °C |
| Sg | Acceleration <i>g</i> for 0.1 ms | 10,000 | <i>g</i> |
| ESD | Electrostatic discharge protection | 2 (HBM) | kV |

This is a mechanical shock sensitive device, improper handling can cause permanent damage to the part

This is an ESD sensitive device, improper handling can cause permanent damage to the part

2.6 Terminology

2.6.1 Sensitivity

An angular rate gyroscope is a device that produces a positive-going digital output for counter-clockwise rotation around the sensitive axis considered. Sensitivity describes the gain of the sensor and can be determined by applying a defined angular velocity to it. This value changes very little over temperature and time.

2.6.2 Zero-rate level

The zero-rate level describes the actual output signal if there is no angular rate present. The zero-rate level of precise MEMS sensors is, to some extent, a result of stress to the sensor and, therefore, the zero-rate level can slightly change after mounting the sensor onto a printed circuit board or after exposing it to extensive mechanical stress. This value changes very little over temperature and time.

2.6.3 Stability over temperature and time

Thanks to the unique single-driving mass approach and optimized design, ST gyroscopes are able to guarantee a perfect match of the MEMS mechanical mass and the ASIC interface, and deliver unprecedented levels of stability over temperature and time.

With the zero-rate level and sensitivity performances, up to ten times better than equivalent products currently available on the market, the A3G4250D allows the user to avoid any further compensation and calibration during production for a faster time to market, easy application implementation, higher performance, and cost saving.

2.7 Soldering information

The LGA package is compliant with the ECOPACK[®], RoHS and “Green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020.

Leave “pin 1 indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at www.st.com/.

3 Main digital blocks

3.1 Block diagram

Figure 6. Block diagram

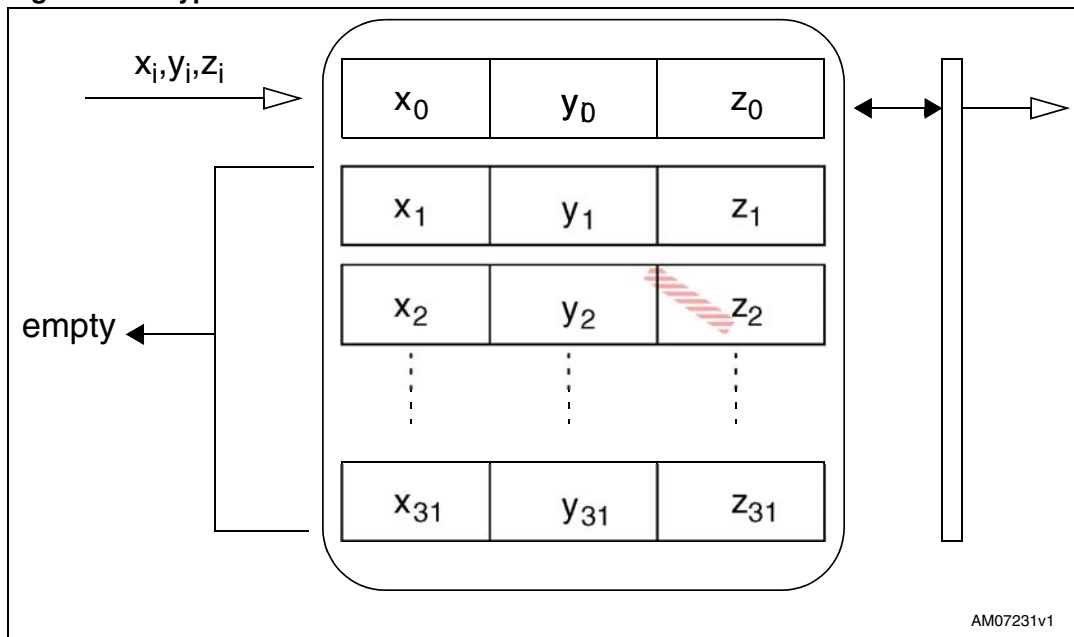

3.2 FIFO

The A3G4250D embeds a 32-slot, 16-bit data FIFO for each of the three output channels: yaw, pitch, and roll. This allows consistent power saving for the system, as the host processor does not need to continuously poll data from the sensor. Instead, it can wake up only when needed and burst the significant data out from the FIFO. This buffer can work in five different modes. Each mode is selected by the FIFO_MODE bits in FIFO_CTRL_REG. Programmable watermark level, FIFO_empty or FIFO_Full events can be enabled to generate dedicated interrupts on the DRDY/INT2 pin (configured through CTRL_REG3), and event detection information is available in FIFO_SRC_REG. The watermark level can be configured to WTM4: 0 in FIFO_CTRL_REG.

3.2.1 Bypass mode

In bypass mode, the FIFO is not operational and for this reason it remains empty. As illustrated in [Figure 7](#), only the first address is used for each channel. The remaining FIFO slots are empty. When new data is available, the old data is overwritten.

Figure 7. Bypass mode

3.2.2 FIFO mode

In FIFO mode, data from the yaw, pitch, and roll channels are stored in the FIFO. A watermark interrupt can be enabled (I2_WMK bit in CTRL_REG3), which is triggered when the FIFO is filled to the level specified in the WTM 4: 0 bits of FIFO_CTRL_REG. The FIFO continues filling until it is full (32 slots of 16-bit data for yaw, pitch, and roll). When full, the FIFO stops collecting data from the input channels. To restart data collection, it is necessary to write FIFO_CTRL_REG back to bypass mode.

FIFO mode is represented in [Figure 8](#).

Figure 8. FIFO mode

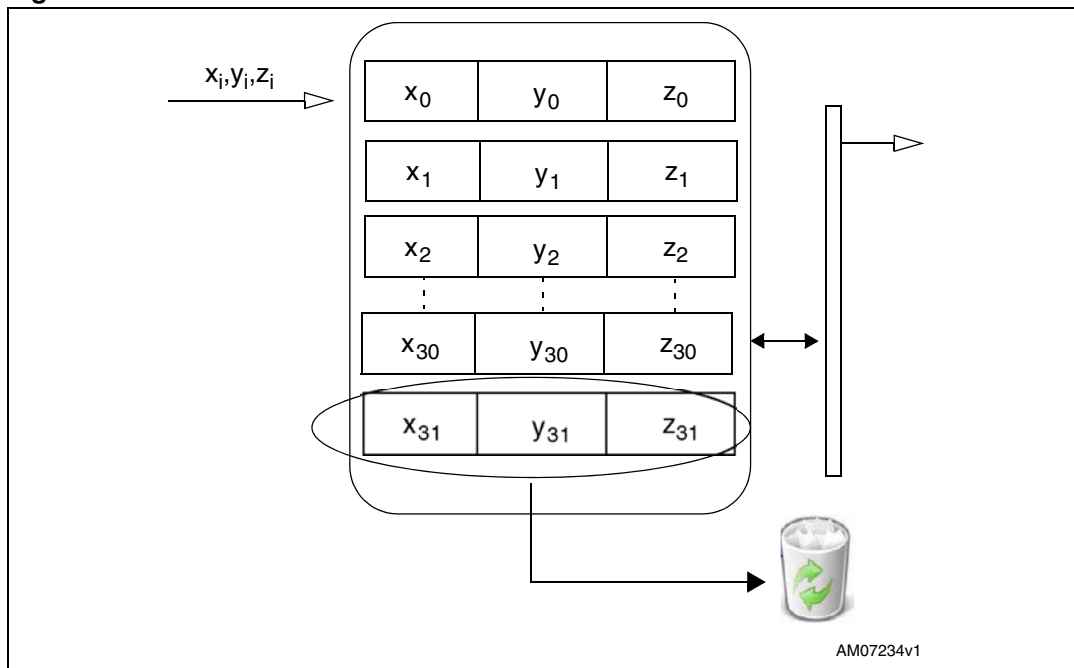

3.2.3 Stream mode

In stream mode, data from yaw, pitch, and roll measurements are stored in the FIFO. A watermark interrupt can be enabled and set as in FIFO mode. The FIFO continues filling until full (32 slots of 16-bit data for yaw, pitch, and roll). When full, the FIFO discards the older data as the new data arrives. Programmable watermark level events can be enabled to generate dedicated interrupts on the DRDY/INT2 pin (configured through CTRL_REG3).

Stream mode is represented in [Figure 9](#).

Figure 9. Stream mode

3.2.4 Retrieve data from FIFO

FIFO data is read through the OUT_X, OUT_Y, and OUT_Z registers. When the FIFO is in stream, trigger or FIFO mode, a read operation to the OUT_X, OUT_Y or OUT_Z registers provides the data stored in the FIFO. Each time data is read from the FIFO, the oldest pitch, roll, and yaw data are placed in the OUT_X, OUT_Y and OUT_Z registers, and both single read and read_burst (X, Y & Z with auto-incremental address) operations can be used. In read_burst mode, when data included in OUT_Z_H is read, the system again starts to read information from addr OUT_X_L.

The reading from FIFO may be executed either in synchronous or asynchronous mode. For correct data acquisition, the following points need to be followed:

1. If reading is synchronous, all data should be acquired within one ODR cycle
2. If reading is asynchronous, an appropriate FIFO access sequence must be applied:
 - a) A single dummy read @ 28h (increment bit = 0) to update data out
 - b) A burst read of 6 bytes from 2Ah (Y low) up to 29h:
 - Y(2A-2Bh)
 - Z(2C - 2Dh)
 - X(28-29h)

Figure 10 illustrates the correct sequence with a flow diagram:

Figure 10. FIFO access sequence in asynchronous mode

If the above sequence is not followed, the acquisition from FIFO may lead to corrupted data.

4 Application hints

Figure 11. A3G4250D electrical connections and external component values

Power supply decoupling capacitors (100 nF ceramic or polyester +10 μF) should be placed as near as possible to the device (common design practice).

If Vdd and Vdd_IO are not connected together, power supply decoupling capacitors (100 nF and 10 μF between Vdd and common ground, 100 nF between Vdd_IO and common ground) should be placed as near as possible to the device (common design practice).

The A3G4250D IC includes a PLL (phase locked loop) circuit to synchronize driving and sensing interfaces. Capacitors and resistors must be added at the PLLFILT pin (as shown in Figure 11) to implement a second-order low-pass filter. Table 10 summarizes the PLL low-pass filter component values.

Table 10. PLL low-pass filter component values

| Component | Value |
|-----------|-------------|
| C1 | 10 nF ± 10% |

Table 10. PLL low-pass filter component values

| Component | Value |
|-----------|-------------------------|
| C2 | 470 nF \pm 10% |
| R2 | 10 k Ω \pm 10% |

5 Digital interfaces

The registers embedded in the A3G4250D may be accessed through both the I²C and SPI serial interfaces. The latter may be software-configured to operate either in 3-wire or 4-wire interface mode.

The serial interfaces are mapped onto the same pins. To select/exploit the I²C interface, the CS line must be tied high (i.e., connected to Vdd_IO).

Table 11. Serial interface pin description

| Pin name | Pin description |
|-------------|--|
| CS | SPI enable I ² C/SPI mode selection (1: SPI idle mode / I ² C communication enabled; 0: SPI communication mode / I ² C disabled) |
| SCL/SPC | I ² C serial clock (SCL) SPI serial port clock (SPC) |
| SDA/SDI/SDO | I ² C serial data (SDA) SPI serial data input (SDI) 3-wire interface serial data output (SDO) |
| SDO | SPI serial data output (SDO) I ² C least significant bit of the device address |

5.1 I²C serial interface

The A3G4250D I²C is a bus slave. The I²C is employed to write data to registers whose content can also be read back.

The relevant I²C terminology is given in the table below.

Table 12. I²C terminology

| Term | Description |
|-------------|--|
| Transmitter | The device which sends data to the bus |
| Receiver | The device which receives data from the bus |
| Master | The device which initiates a transfer, generates clock signals and terminates a transfer |
| Slave | The device addressed by the master |

There are two signals associated with the I²C bus: the serial clock line (SCL) and the serial data line (SDA). The latter is a bi-directional line used for sending and receiving the data to/from the interface. Both lines must be connected to Vdd_IO through an external pull-up resistor. When the bus is free both the lines are high.

The I²C interface is compliant with fast mode (400 kHz) I²C standards as well as with normal mode.

5.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a HIGH to LOW transition on the data line while the SCL line is held HIGH. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and the eighth bit tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first 7 bits after a start condition with its address. If they match, the device considers itself addressed by the master.

The slave address (SAD) associated with the A3G4250D is 110100xb. The SDO pin can be used to modify the least significant bit (LSb) of the device address. If the SDO pin is connected to the voltage supply, LSb is '1' (address 1101001b). Otherwise, when the SDO pin is connected to ground, the LSb value is '0' (address 1101000b). This solution permits the connection and addressing of two different gyroscopes to the same I²C bus.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line LOW so that it remains stable low during the HIGH period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded in the A3G4250D behaves like a slave device, and the following protocol must be adhered to. After the START (ST) condition, a slave address is sent. Once a slave acknowledge (SAK) has been returned, an 8-bit sub-address is transmitted. The 7 LSb represent the actual register address while the MSb enables address auto-increment. If the MSb of the SUB field is 1, the SUB (register address) is automatically incremented to allow multiple data read/write.

The slave address is completed with a read/write bit. If the bit is '1' (read), a REPEATED START (SR) condition must be issued after the two sub-address bytes; if the bit is '0' (write) the master transmits to the slave with the direction unchanged. [Table 13](#) describes how the SAD+read/write bit pattern is composed, listing all the possible configurations.

Table 13. SAD+read/write patterns

| Command | SAD[6:1] | SAD[0] = SDO | R/W | SAD+R/W |
|---------|----------|--------------|-----|----------------|
| Read | 110100 | 0 | 1 | 11010001 (D1h) |
| Write | 110100 | 0 | 0 | 11010000 (D0h) |
| Read | 110100 | 1 | 1 | 11010011 (D3h) |
| Write | 110100 | 1 | 0 | 11010010 (D2h) |

Table 14. Transfer when master is writing one byte to slave

| | | | | | | | | |
|--------|----|---------|-----|-----|-----|------|-----|----|

| Slave | | | SAK | | SAK | | SAK | | SAK | |

Table 16. Transfer when master is receiving (reading) one byte of data from slave

| | | | | | | | | | | | |
|--------|----|---------|-----|-----|-----|----|---------|-----|------|------|----|
| Master | ST | SAD + W | | SUB | | SR | SAD + R | | | NMAK | SP |
| Slave | | | SAK | | SAK | | | SAK | DATA | | |

Table 17. Transfer when master is receiving (reading) multiple bytes of data from slave

| | | | | | | | | | | | | | | | |
|--------|----|-------|-----|-----|-----|----|-------|-----|------|-----|------|-----|------|------|----|
| Master | ST | SAD+W | | SUB | | SR | SAD+R | | | MAK | | MAK | | NMAK | SP |
| Slave | | | SAK | | SAK | | | SAK | DATA | | DATA | | DATA | | |

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSb) first. If a receiver cannot receive another complete byte of data until it has performed some other function, it can hold the clock line SCL LOW to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver does not acknowledge the slave address (i.e., it is not able to receive because it is performing some real-time function) the data line must be left HIGH by the slave. The master can then abort the transfer. A LOW to HIGH transition on the SDA line while the SCL line is HIGH is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1, while SUB(6-0) represents the address of the first register to be read.

In the presented communication format, MAK is “master acknowledge” and NMAK is “no master acknowledge”.

5.2 SPI bus interface

The SPI is a bus slave. The SPI allows writing and reading of the device registers. The serial interface interacts with the external world through 4 wires: **CS, SPC, SDI, and SDO**.

Figure 12. Read and write protocol

CS is the serial port enable and is controlled by the SPI master. It goes low at the start of the transmission and returns to high at the end. **SPC** is the serial port clock and is controlled by the SPI master. It is stopped high when **CS** is high (no transmission). **SDI** and **SDO** are, respectively, the serial port data input and output. These lines are driven at the falling edge of **SPC** and should be captured at the rising edge of **SPC**.

Both the read register and write register commands are completed in 16 clock pulses, or in multiples of 8 in case of multiple read/write bytes. Bit duration is the time between two falling edges of **SPC**. The first bit (bit 0) starts at the first falling edge of **SPC** after the falling edge of **CS** while the last bit (bit 15, bit 23, etc.) starts at the last falling edge of **SPC** just before the rising edge of **CS**.

Bit 0: $R\bar{W}$ bit. When 0, the data DI(7:0) is written to the device. When 1, the data DO(7:0) from the device is read. In the latter case, the chip drives **SDO** at the start of bit 8.

Bit 1: $\bar{M}\bar{S}$ bit. When 0, the address remains unchanged in multiple read/write commands. When 1, the address is auto-incremented in multiple read/write commands.

Bit 2-7: address AD(5:0). This is the address field of the indexed register.

Bit 8-15: data DI(7:0) (write mode). This is the data that is written to the device (MSb first).

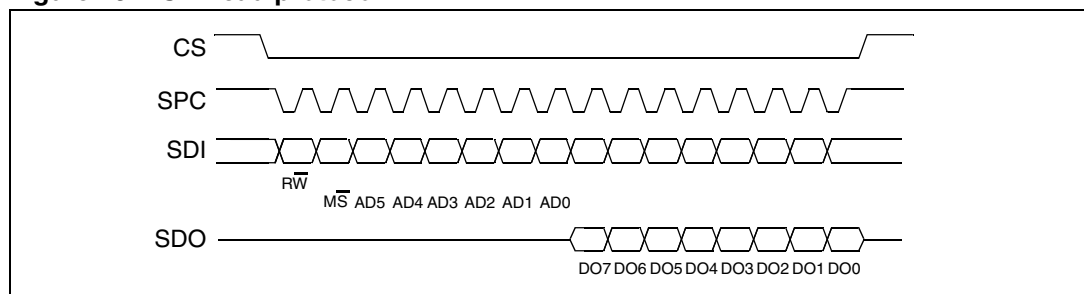

Bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

In multiple read/write commands, further blocks of 8 clock periods are added. When the $\bar{M}\bar{S}$ bit is 0, the address used to read/write data remains the same for every block. When the $\bar{M}\bar{S}$ bit is 1, the address used to read/write data is incremented at every block.

The function and the behavior of **SDI** and **SDO** remain unchanged.

5.2.1 SPI read

Figure 13. SPI read protocol

The SPI read command is performed with 16 clock pulses. A multiple byte read command is performed by adding blocks of 8 clock pulses to the previous one.

Bit 0: READ bit. The value is 1.

Bit 1: \overline{MS} bit. When 0, do not increment address; when 1, increment address in multiple reading.

Bit 2-7: address AD(5:0). This is the address field of the indexed register.

Bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

Bit 16-...: data DO(...-8). Further data in multiple byte reading.

Figure 14. Multiple byte SPI read protocol (2-byte example)

5.2.2 SPI write

Figure 15. SPI write protocol

The SPI write command is performed with 16 clock pulses. A multiple byte write command is performed by adding blocks of 8 clock pulses to the previous one.

Bit 0: WRITE bit. The value is 0.

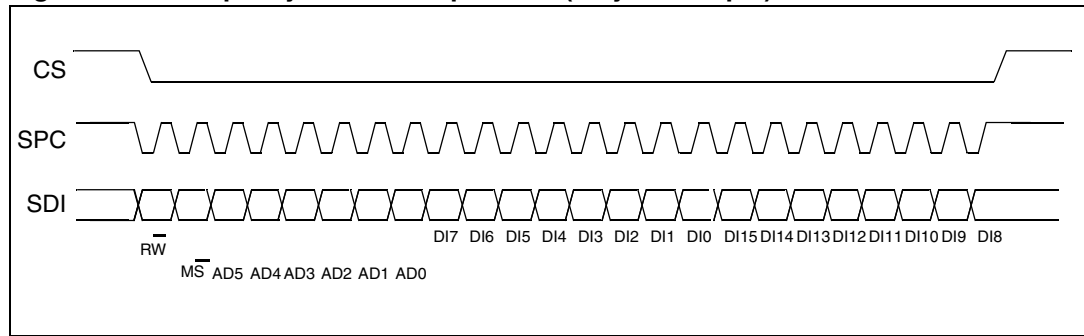

Bit 1: \overline{MS} bit. When 0, do not increment address; when 1, increment address in multiple writing.

Bit 2 -7: address AD(5:0). This is the address field of the indexed register.

Bit 8-15: data DI(7:0) (write mode). This is the data that is written to the device (MSb first).

Bit 16-...: data DI(...-8). Further data in multiple byte writing.

Figure 16. Multiple byte SPI write protocol (2-byte example)

5.2.3 SPI read in 3-wire mode

3-wire mode is entered by setting the SIM (SPI serial interface mode selection) bit to 1 in CTRL_REG2.

Figure 17. SPI read protocol in 3-wire mode

The SPI read command is performed with 16 clock pulses:

Bit 0: READ bit. The value is 1.

Bit 1: \overline{MS} bit. When 0, do not increment address; when 1, increment address in multiple reading.

Bit 2-7: address AD(5:0). This is the address field of the indexed register.

Bit 8-15: data DO(7:0) (read mode). This is the data that is read from the device (MSb first).

The multiple read command is also available in 3-wire mode.

Note: If the A3G4250D is used in a multi-SPI slave environment (several devices sharing the same SPI bus), the accelerometer can be forced by software to remain in SPI mode. This objective can be achieved by sending, at the beginning of the SPI communication, the following sequence to the device:

```
a = read(0x05)
write(0x05, (0x20 OR a))
```

The programming of this register makes it possible to enhance the robustness of the SPI system.

6 Output register mapping

[Table 18](#) below provides a listing of the 8-bit registers embedded in the device and the related addresses:

Table 18. Register address map

| Name | Type | Register address | | Default | Comment |
|---------------|------|------------------|----------|----------|---------|

Registers marked as *Reserved* must not be changed. Writing to those registers may change calibration data and therefore lead to a non-proper working device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibration values. Their content is automatically restored when the device is powered up.

7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve rate data. The register addresses, made up of 7 bits, are used to identify them and to write the data through the serial interface.

7.1 WHO_AM_I (0Fh)

Table 19. WHO_AM_I register

|-----|------|-------|------|------|------|------|------|

Table 47. FIFO_SRC register description

| | |
|------|--|
| WTM | Watermark status. (0: FIFO filling is lower than WTM level; 1: FIFO filling is equal or higher than WTM level) |
| OVRN | Overflow bit status. (0: FIFO is not completely filled; 1: FIFO is completely filled) |

Table 47. FIFO_SRC register description (continued)

| | |
|-----------|---|
| EMPTY | FIFO empty bit. (0: FIFO not empty; 1: FIFO empty) |
| FSS4-FSS1 | FIFO stored data level |

7.15 INT1_CFG (30h)

Table 48. INT1_CFG register

| | | | | | | | |
|--------|-----|------|------|------|------|------|------|
| AND/OR | LIR | ZHIE | ZLIE | YHIE | YLIE | XHIE | XLIE |
|--------|-----|------|------|------|------|------|------|

Table 49. INT1_CFG description

| | |
|--------|--|
| AND/OR | AND/OR combination of interrupt events. Default value: 0 (0: OR combination of interrupt events 1: AND combination of interrupt events) |
| LIR | Latch interrupt request. Default value: 0 (0: interrupt request not latched; 1: interrupt request latched) Cleared by reading the INT1_SRC reg. |
| ZHIE | Enable interrupt generation on Z high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured rate value higher than preset threshold) |
| ZLIE | Enable interrupt generation on Z low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured rate value lower than preset threshold) |
| YHIE | Enable interrupt generation on Y high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured rate value higher than preset threshold) |
| YLIE | Enable interrupt generation on Y low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured rate value lower than preset threshold) |
| XHIE | Enable interrupt generation on X high event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured rate value higher than preset threshold) |
| XLIE | Enable interrupt generation on X low event. Default value: 0 (0: disable interrupt request; 1: enable interrupt request on measured rate value lower than preset threshold) |

Configuration register for interrupt source.

7.16 INT1_SRC (31h)

Table 50. INT1_SRC register

| | | | | | | | |
|---|----|----|----|----|----|----|----|
| 0 | IA | ZH | ZL | YH | YL | XH | XL |
|---|----|----|----|----|----|----|----|

Table 51. INT1_SRC description

| | |
|----|---|
| IA | Interrupt active. Default value: 0 (0: no interrupt has been generated; 1: one or more interrupts have been generated) |
| ZH | Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred) |
| ZL | Z low. Default value: 0 (0: no interrupt; 1: Z low event has occurred) |
| YH | Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred) |
| YL | Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred) |
| XH | X high. Default value: 0 (0: no interrupt, 1: X high event has occurred) |
| XL | X low. Default value: 0 (0: no interrupt, 1: X low event has occurred) |

Interrupt source register. Read only register.

Reading at this address clears the INT1_SRC IA bit (and eventually the interrupt signal on the INT1 pin) and allows the refreshment of data in the INT1_SRC register if the latched option is chosen.

7.17 INT1_THS_XH (32h)

Table 52. INT1_THS_XH register

| | | | | | | | |
|---|--------|--------|--------|--------|--------|-------|-------|
| - | THSX14 | THSX13 | THSX12 | THSX11 | THSX10 | THSX9 | THSX8 |
|---|--------|--------|--------|--------|--------|-------|-------|

| | |
|----------------|---|
| THSX14 - THSX9 | Interrupt threshold. Default value: 0000 0000 |
|----------------|---|

7.18 INT1_THS_XL (33h)

Table 54. INT1_THS_XL register

| | | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|-------|
| THSX7 | THSX6 | THSX5 | THSX4 | THSX3 | THSX2 | THSX1 | THSX0 |
|-------|-------|-------|-------|-------|-------|-------|-------|

Table 55. INT1_THS_XL description

| | |
|---------------|---|
| THSX7 - THSX0 | Interrupt threshold. Default value: 0000 0000 |
|---------------|---|

7.19 INT1_THS_YH (34h)

Table 56. INT1_THS_YH register

| | | | | | | | |
|---|--------|--------|--------|--------|--------|-------|-------|
| - | THSY14 | THSY13 | THSY12 | THSY11 | THSY10 | THSY9 | THSY8 |
|---|--------|--------|--------|--------|--------|-------|-------|

Table 57. INT1_THS_YH description

| | |
|----------------|---|
| THSY14 - THSY9 | Interrupt threshold. Default value: 0000 0000 |
|----------------|---|

7.20 INT1_THS_YL (35h)

Table 58. INT1_THS_YL register

| | | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|-------|
| THSR7 | THSY6 | THSY5 | THSY4 | THSY3 | THSY2 | THSY1 | THSY0 |
|-------|-------|-------|-------|-------|-------|-------|-------|

Table 59. INT1_THS_YL description

| | |
|---------------|---|
| THSY7 - THSY0 | Interrupt threshold. Default value: 0000 0000 |
|---------------|---|

7.21 INT1_THS_ZH (36h)

Table 60. INT1_THS_ZH register

| | | | | | | | |
|---|--------|--------|--------|--------|--------|-------|-------|
| - | THSZ14 | THSZ13 | THSZ12 | THSZ11 | THSZ10 | THSZ9 | THSZ8 |
|---|--------|--------|--------|--------|--------|-------|-------|

Table 61. INT1_THS_ZH description

| | |
|----------------|---|
| THSZ14 - THSZ9 | Interrupt threshold. Default value: 0000 0000 |
|----------------|---|

7.22 INT1_THS_ZL (37h)

Table 62. INT1_THS_ZL register

| | | | | | | | |
|-------|-------|-------|-------|-------|-------|-------|-------|
| THSZ7 | THSZ6 | THSZ5 | THSZ4 | THSZ3 | THSZ2 | THSZ1 | THSZ0 |
|-------|-------|-------|-------|-------|-------|-------|-------|

Table 63. INT1_THS_ZL description

| | |
|---------------|---|
| THSZ7 - THSZ0 | Interrupt threshold. Default value: 0000 0000 |
|---------------|---|

7.23 INT1_DURATION (38h)

Table 64. INT1_DURATION register

| | | | | | | | |
|------|----|----|----|----|----|----|----|
| WAIT | D6 | D5 | D4 | D3 | D2 | D1 | D0 |
|------|----|----|----|----|----|----|----|

Table 65. INT1_DURATION description

| | |
|---------|---|
| WAIT | WAIT enable. Default value: 0 (0: disable; 1: enable) |
| D6 - D0 | Duration value. Default value: 000 0000 |

D6 - D0 bits set the minimum duration of the interrupt event to be recognized. Duration steps and maximum values depend on the ODR chosen.

WAIT bit has the following meaning:

Wait = '0': the interrupt falls immediately if signal crosses the selected threshold.

Wait = '1': if signal crosses the selected threshold, the interrupt falls only after the duration has counted a number of samples at the selected data rate, written into the duration counter register.

Figure 19. Wait disabled

Figure 20. Wait enabled

8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at www.st.com. ECOPACK is an ST trademark.

9 Revision history

Table 66. Document revision history

| Date | Revision | Changes |
|-------------|----------|---|
| 02-Feb-2012 | 1 | Initial release. |
| 08-Feb-2012 | 2 | Updated notes in Table 4: Mechanical characteristics . |
| 14-Feb-2012 | 3 | Updated Figure 21: LGA-16: mechanical data and package dimensions . |

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

UNLESS EXPRESSLY APPROVED IN WRITING BY TWO AUTHORIZED ST REPRESENTATIVES, ST PRODUCTS ARE NOT RECOMMENDED, AUTHORIZED OR WARRANTED FOR USE IN MILITARY, AIR CRAFT, SPACE, LIFE SAVING, OR LIFE SUSTAINING APPLICATIONS, NOR IN PRODUCTS OR SYSTEMS WHERE FAILURE OR MALFUNCTION MAY RESULT IN PERSONAL INJURY, DEATH, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE. ST PRODUCTS WHICH ARE NOT SPECIFIED AS "AUTOMOTIVE GRADE" MAY ONLY BE USED IN AUTOMOTIVE APPLICATIONS AT USER'S OWN RISK.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
