

Adjustable Precision Shunt Regulators

FEATURES

- Unconditionally Stable.
- Precision Reference Voltage.
 AIC431 :2.495V \pm 0.5%
 TL431A :2.495V \pm 1.0%
 TL431 :2.495V \pm 1.6%
- Sink Current Capability: 200mA.
- Minimum Cathode Current for Regulation: 250 μ A.
- Equivalent Full-Range Temperature Coefficient: 50 ppm/ $^{\circ}$ C.
- Fast Turn-On Response.
- Low Dynamic Output Impedance: 0.08 Ω .
- Adjustable Output Voltage.
- Low Output Noise.
- Space Saving SOT-89, SOT-23, TO-92 and SO8 packages.

DESCRIPTION

The AIC431/TL431A/TL431 are 3-terminal adjustable precision shunt regulators with guaranteed temperature stability over the applicable extended commercial temperature range. The output voltage may be set at any level greater than 2.495V (V_{REF}) up to 30V merely by selecting two external resistors that act as a voltage divider network. These devices have a typical output impedance of 0.08 Ω . Active output circuitry provides a very sharp turn-on characteristics, making these devices excellent improved replacements for zener diodes in many applications.

The precise \pm 0.5% reference voltage tolerance of the AIC431 makes it possible in many applications to avoid the use of a variable resistor, consequently saving cost and eliminating drift and reliability problems associated with it.

PARAMETER	TEST CONDITIONS	SYMBOL	MIN.	TYP.	MAX.	UNIT
Minimum Cathode current for Regulation	$V_Z = V_{REF}$ (Fig. 1)	$I_{Z(MIN)}$		0.25	0.5	mA

Note 3. Deviation of reference input voltage, V_{DEV} , is defined as the maximum variation of the reference input voltage over the full temperature range.

The average temperature coefficient of the reference input voltage, αV_{REF} is defined as:

$$\Delta V_{REF} \frac{\text{ppm}}{^\circ\text{C}} = \frac{\pm \left[\frac{V_{MAX} - V_{MIN}}{V_{REF}(\text{at } 25^\circ\text{C})} \right] 10^6}{T_2 - T_1} = \frac{\pm \left[\frac{V_{DEV}}{V_{REF}(\text{at } 25^\circ\text{C})} \right] 10^6}{T_2 - T_1}$$

Where:

$T_2 - T_1$ = full temperature change.

αV_{REF} can be positive or negative depending on whether the slope is positive or negative.

Example: $V_{DEV} = 9.0\text{mV}$, $V_{REF} = 2495\text{mV}$,
 $T_2 - T_1 = 70^\circ\text{C}$, slope is negative.

$$\alpha V_{REF} = \frac{\left[\frac{9.0\text{mV}}{2495\text{mV}} \right] 10^6}{70^\circ\text{C}} = -50\text{ppm}/^\circ\text{C}$$

Note 4. The dynamic output impedance, R_Z , is defined as:

$$R_Z = \frac{\Delta V_Z}{\Delta I_Z}$$

When the device is programmed with two external resistors, R_1 and R_2 , (see Fig. 2), the dynamic output impedance of the overall circuit, is defined as:

$$r_z = \frac{\Delta V_Z}{\Delta I_Z} \cong R_Z \left[1 + \frac{R_1}{R_2} \right]$$
