

# MICRO POWER STEP-UP DC-DC CONVERTER

#### **General Description**

The AP3015/A are Pulse Frequency Modulation (PFM) DC/DC converters. These two devices are functionally equivalent except the switching current limit. The AP3015 is designed for higher power systems with 350mA current limit, and the AP3015A is for lower power systems with 100mA current limit.

The AP3015/A feature a wide input voltage. The operation voltage is ranged from 1.2Vto 12V (1V to 12V for AP3015A). A current limited, fixed off-time control scheme conserves operating current, resulting in high efficiency over a broad range of load current. They also feature low quiescent current, switching current limiting, low temperature coefficient, etc.

Fewer tiny external components are required in the applications to save space and lower cost. Furthermore, to ease its use in different systems, a disable terminal is designed to turn on or turn off the chip.

The AP3015/A are available in SOT-23-5 package.

#### Features

- Low Quiescent Current In Active Mode (Not Switching): 17µA Typical In Shutdown Mode: <1µA
- Low Operating V<sub>IN</sub>
  1.2V Typical for AP3015
  1.0V Typical for AP3015A
- Low V<sub>CESAT</sub> Switch
  200mV Typical at 300mA for AP3015
  70mV Typical at 70mA for AP3015A
- High Output Voltage: up to 34V
- Fixed Off-Time Control
- Switching Current Limiting 350mA Typical for AP3015 100mA Typical for AP3015A
- Operating Temperature Range: -40°C to 85°C

## **Applications**

- MP3, MP4
- Battery Power Supply System
- LCD/OLED Bias Supply
- Handheld Device
- Portable Communication Device

# Pin Configuration

# K Package (SOT-23-5)

# **Pin Description**

| Pin Number | Pin Name        | Function  |  |  |
|------------|-----------------|---|--|--|
| 1          | SW              | Switch Pin. This is the collector of the internal NPN power switch. Minimize the trace area connected to this Pin to minimize EMI   |  |  |
| 2          | GND             | Ground Pin. GND should be tied directly to ground plane for best performance  |  |  |
| 3          | FB              | Feedback Pin. Set the output voltage through this pin. The formula is $V_{OUT}=1.23V*(1+R1/R2)$ . Keep the loop between Vout and FB as short as possible to minimize the ripple and noise, which is beneficial to the stability and output ripple |  |  |
| 4          | SHDN            | Shutdown Control Pin. Tie this pin above 0.9V to enable the device. Tie below 0.25V to turn off the device  |  |  |
| 5          | V <sub>IN</sub> | Supply Input Pin. Bypass this pin with a capacitor as close to the device as possible   |  |  |

Figure 12. Efficiency

#### **Application Information**

#### **Operating Principles**

AP3015/A feature a constant off-time control scheme. Refer to Figure 3, the bandgap voltage  $V_{REF}$  (1.23V typical) is used to control the output voltage.

When the voltage at the FB pin drops below the lower hysteresis point of Feedback Comparator (typical hysteresis is 8mV), the Feedback Comparator enables the chip and the NPN power switch is turned on, the current in the inductor begins to ramp up and store energy in the coil while the load current is supplied by the output capacitor. Once the current in the inductor reaches the current limit, the Current-Limit Comparator resets the 400ns One-Shot which turns off the NPN switch for 400ns. The SW voltage rises to the output voltage plus a diode drop and the inductor current begins to ramp down. During this time the energy stored in the inductor is transferred to C<sub>OUT</sub> and the load. After the 400ns off-time, the NPN switch is turned on and energy will be stored in the inductor again.

This cycle will continue until the voltage at FB pin reaches 1.23V, the Feedback Comparator disables the

Figure 13. Efficiency

chip and turns off the NPN switch. The load current is then supplied solely by output capacitor and the output voltage will decrease. When the FB pin voltage drops below the lower hysteresis point of Feedback Comparator, the Feedback Comparator enables the device and repeats the cycle described previously. Under not switching condition, the  $I_Q$  of the device is about  $17\mu A$ .

The AP3015/A contain additional circuitry to provide protection during start-up or under short-circuit conditions. When the FB pin voltage is lower than approximately 0.6V, the switch off-time is increased to 1.5µs and the current limit is reduced to about 250mA (70mA for AP3015A). This reduces the average inductor current and helps to minimize the power dissipation in the AP3015/A power switch, in the external inductor and in the diode.

The SHDN pin can be used to turn off the AP3015/A and reduce the  $I_Q$  to less than 1µA. In shutdown mode the output voltage will be a diode drop below the input voltage.
