AT27BV512

Features

- Fast Read Access Time 90 ns
 - Dual Voltage Range Operation
 Unregulated Battery Power Supply Range, 2.7V to 3.6V
 or Standard 5V ± 10% Supply Range
- Pin Compatible with JEDEC Standard AT27C512
- Low Power CMOS Operation
 20 μA max. (less than 1μA typical) Standby for V_{CC} = 3.6V
 29 mW max. Active at 5 MHz for V_{CC} = 3.6V
- JEDEC Standard Surface Mount Packages 32-Lead PLCC 28-Lead 330-mil SOIC
 - 28-Lead TSOP
- High Reliability CMOS Technology 2,000V ESD Protection 200 mA Latchup Immunity
- Rapid[™] Programming Algorithm 100 µs/byte (typical)
- CMOS and TTL Compatible Inputs and Outputs JEDEC Standard for LVTTL and LVBO
- Integrated Product Identification Code
- Commercial and Industrial Temperature Ranges

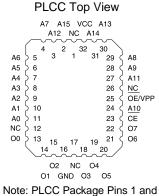

Description

The AT27BV512 is a high performance, low power, low voltage 524,288 bit one-time programmable read only memory (OTP EPROM) organized as 64K by 8 bits. It requires only one supply in the range of 2.7V to 3.6V in normal read mode operation, making it ideal for fast, portable systems using either regulated or unregulated battery power.

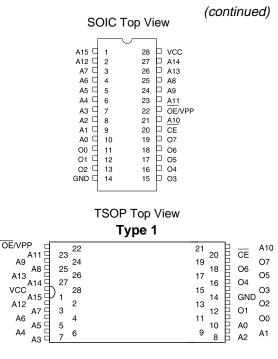

Atmel's innovative design techniques provide fast speeds that rival 5V parts while keeping the low power consumption of a 3V supply. At V_{CC} = 2.7V, any byte can be accessed in less than 90 ns. With a typical power consumption of only 18 mW at 5 MHz and V_{CC} = 3V, the AT27BV512 consumes less than one fifth the power of a standard 5V EPROM.

Pin Configurations

Pin Name	Function
A0 - A15	Addresses
00 - 07	Outputs
CE	Chip Enable
OE/V _{PP}	Output Enable
NC	No Connect

17 are DON'T CONNECT.

AIMEL

512K (64K x 8) Unregulated *Battery-Voltage*[™] High Speed OTP CMOS EPROM

3-13

Description (Continued)

Standby mode supply current is typically less than 1 μ A at 3V. The AT27BV512 simplifies system design and stretches battery lifetime even further by eliminating the need for power supply regulation.

The AT27BV512 is available in industry standard JEDECapproved one-time programmable (OTP) plastic PLCC, SOIC, and TSOP packages. All devices feature two-line control (\overline{CE} , \overline{OE}) to give designers the flexibility to prevent bus contention.

The AT27BV512 operating with V_{CC} at 3.0V produces TTL level outputs that are compatible with standard TTL logic devices operating at V_{CC} = 5.0V. At V_{CC} = 2.7V, the part is compatible with JEDEC approved low voltage battery operation (LVBO) interface specifications. The device is also capable of standard 5-volt operation making it ideally suited for dual supply range systems or card products that are pluggable in both 3-volt and 5-volt hosts.

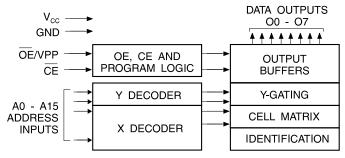

Atmel's AT27BV512 has additional features to ensure high quality and efficient production use. The RapidTM Programming Algorithm reduces the time required to program the part and guarantees reliable programming. Programming time is typically only 100 µs/byte. The Integrated Product Identification Code electronically identifies the device and manufacturer. This feature is used by industry standard programming equipment to select the proper programming algorithms and voltages. The AT27BV512 programs exactly the same way as a standard 5V AT27C512R and uses the same programming equipment.

System Considerations

Switching between active and standby conditions via the Chip Enable pin may produce transient voltage excursions. Unless accommodated by the system design, these transients may exceed data sheet limits, resulting in device non-conformance. At a minimum, a 0.1 μ F high frequency, low inherent inductance, ceramic capacitor should be utilized for each device. This capacitor should be connected between the V_{CC} and Ground terminals of the device, as close to the device as possible. Additionally, to stabilize the supply voltage level on printed circuit boards with large EPROM arrays, a 4.7 μ F bulk electrolytic capacitor should be utilized, again connected between the V_{CC} and Ground terminals. This capacitor should be positioned as close as possible to the point where the power supply is connected to the array.

AT27BV512

Block Diagram

Absolute Maximum Ratings*

Temperature Under Bias40°C to +85°C	
Storage Temperature65°C to +125°C	
Voltage on Any Pin with Respect to Ground2.0V to +7.0V $^{(1)}$	
Voltage on A9 with Respect to Ground2.0V to +14.0V $^{(1)}$	
V_{PP} Supply Voltage with Respect to Ground2.0V to +14.0V ⁽¹⁾	

*NOTICE: Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Note: 1. Minimum voltage is -0.6V dc which may undershoot to -2.0V for pulses of less than 20 ns. Maximum output pin voltage is V_{CC} + 0.75V dc which may be exceeded if certain precautions are observed (consult application notes) and which may overshoot to +7.0V for pulses of less than 20 ns.

Operating Modes

Mode \ Pin	CE	OE/V _{PP}	Ai	V _{CC}	Outputs
Read ⁽²⁾	VIL	VIL	Ai	V _{CC} ⁽²⁾	Dout
Output Disable ⁽²⁾	VIL	Vih	X ⁽¹⁾	Vcc (2)	High Z
Standby ⁽²⁾	VIH	Х	Х	Vcc (2)	High Z
Rapid Program ⁽³⁾	VIL	VPP	Ai	V _{CC} ⁽³⁾	D _{IN}
PGM Verify ⁽³⁾	VIL	VIL	Ai	Vcc ⁽³⁾	D _{OUT}
PGM Inhibit ⁽³⁾	VIH	Vpp	Х	Vcc ⁽³⁾	High Z
Product Identification ^(3, 5)	VIL	VIL	$A9 = V_{H} (^{4)}$ $A0 = V_{IH} \text{ or } V_{IL}$ $A1 - A15 = V_{IL}$	Vcc ⁽³⁾	Identification Code

Notes: 1. X can be VIL or VIH.

2. Read, output disable, and standby modes require, $2.7V \le V_{CC} \le 3.6V, \mbox{ or } 4.5V \le V_{CC} \le 5.5V.$

3. Refer to Programming Characteristics. Programming modes require $V_{CC} = 6.5V$. 4. V_{H} = 12.0 \pm 0.5V.

5. Two identifier bytes may be selected. All Ai inputs are held low (V_{IL}), except A9 which is set to V_H and A0 which is toggled low (V_{IL}) to select the Manufacturer's Identification byte and high (V_{IH}) to select the Device Code byte.

DC and AC Operating Conditions for Read Operation

Vol	Output Low Voltage	l _{OL} = 2.1 mA		0.4	V
Vон	Output High Voltage	I _{OH} = -400 μA	2.4		V

Notes: 1. $\frac{V_{CC}}{OE}$ must be applied simultaneously with or before $\frac{OE}{OE}/V_{PP}$, and removed simultaneously with or after \overline{OE}/V_{PP} .

AT27BV512

 V_{PP} may be connected directly to V_{CC}, except during programming. The supply current would then be the sum of I_{CC} and I_{PP}.

Notes: 2, 3, 4, 5. - see AC Waveforms for Read Operation.

AC Waveforms for Read Operation ⁽¹⁾

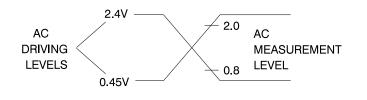

- Notes: 1. Timing measurement references are 0.8V and 2.0V. Input AC drive levels are 0.45V and 2.4V, unless otherwise specified.
 - 2. OE/V_{PP} may be delayed up to t_{CE} t_{OE} after the falling edge of CE without impact on t_{CE}.
 - OE/V_{PP} may be delayed up to t_{ACC} t_{OE} after the address is valid without impact on t_{ACC}.
- 4. This parameter is only sampled and is not 100% tested.
- 5. Output float is defined as the point when data is no longer driven.
- 6. When reading the 27BV512, a 0.1 μF capacitor is required across V_{CC} and grond to supress spurious voltage transients.

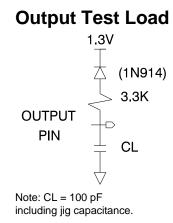

Input Test Waveform and Measurement Level

 t_R , t_F < 20 ns (10% to 90%)

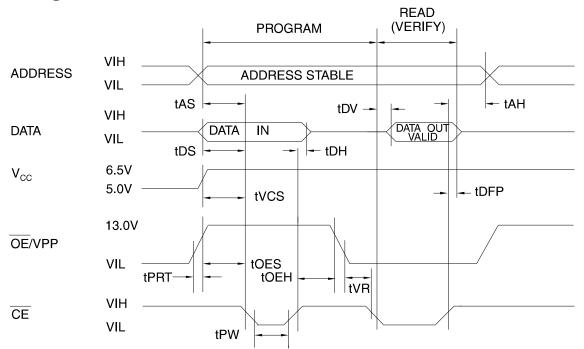

Pin Capacitance (f = 1 MHz, T = 25° C)⁽¹⁾

	Тур	Max	Units	Conditions	
CIN	4	6	pF	$V_{IN} = 0V$	
Соит	8	12	pF	Vout = 0V	

Note: 1. Typical values for nominal supply voltage. This parameter is only sampled and is not 100% tested.

Programming Waveforms⁽¹⁾

- Notes: 1. The Input Timing Reference is 0.8V for V_{IL} and 2.0V for $V_{IH}.$
 - 2. t_{OE} and t_{DFP} are characteristics of the device but must be accommodated by the programmer.
- 3. When programming the 27BV512, a 0.1 μF capacitor is required across V_{PP} and ground to supress spurious voltage transients.

DC Programming Characteristics

T_{A} = 25 $\pm~$ 5°C, V_{CC} = 6.5 $\pm~$ 0.25V, $\overline{\text{OE}}/V_{\text{PP}}$ = 13.0 $\pm~$ 0.25V

Atmel's 27BV512 Integrated Product Identification Code (1)

		Pins					Hex			
Codes	A0	07	O6	O5	O4	O3	O2	01	00	Data
Manufacturer	0	0	0	0	1	1	1	1	0	1E
Device Type	1	0	0	0	0	1	1	0	1	0D

Note: 1. The AT27BV512 has the same Product Identification Code as the AT27C512R. Both are programming compatible.

Rapid Programming Algorithm

A 100 μ s \overline{CE} pulse width is used to program. The address is set to the first location. V_{CC} is raised to 6.5V and OE/V_{PP} is raised to 13.0V. Each address is first programmed with one 100 μ s \overline{CE} pulse without verification. Then a verification / reprogramming loop is executed for each address. In the event a byte fails to pass verification, up to 10 successive 100 μ s pulses are applied with a verification after each pulse. If the byte fails to verify after 10 pulses have been applied, the part is considered failed. After the byte verifies properly, the <u>next</u> address is selected until all have been checked. \overline{OE}/V_{PP} is then lowered to V_{IL} and V_{CC} to 5.0V. All bytes are read again and compared with the original data to determine if the device passes or fails.
