

Ultra Low Power/Voltage CMOS SRAM 1M x 16 or 2M x 8 bit switchable

BS616UV1620

■ FEATURES

- Ultra low operation voltage : 1.8 ~ 2.3V
- Ultra low power consumption :
 - V_{cc} = 1.8V C-grade : 25mA (Max.) operating current
 - I-grade : 30mA (Max.) operating current
 - 1.2uA (Typ.) CMOS standby current
- High speed access time :
 - 70 70ns (Max.) at V_{cc} = 2.0V
 - 10 100ns (Max.) at V_{cc} = 2.0V
- Automatic power down when chip is deselected
- Three state outputs and TTL compatible
- Fully static operation
- Data retention supply voltage as low as 1.5V
- Easy expansion with $\overline{CE1}$, $\overline{CE2}$ and \overline{OE} options
- I/O Configuration x8/x16 selectable by CIO, \overline{LB} and \overline{UB} pin

■ DESCRIPTION

The BS616UV1620 is a high performance, ultra low power CMOS Static Random Access Memory organized as 1,048,676 words by 16 bits or 2,097,152 bytes by 8 bits selectable by CIO pin and operates in a wide range of 1.8V to 2.3V supply voltage.

Advanced CMOS technology and circuit techniques provide both high speed and low power features with a typical CMOS standby current of 1.2uA and maximum access time of 70/100ns in 2.0V operation.

This device provide three control inputs and three states output drivers for easy memory expansion.

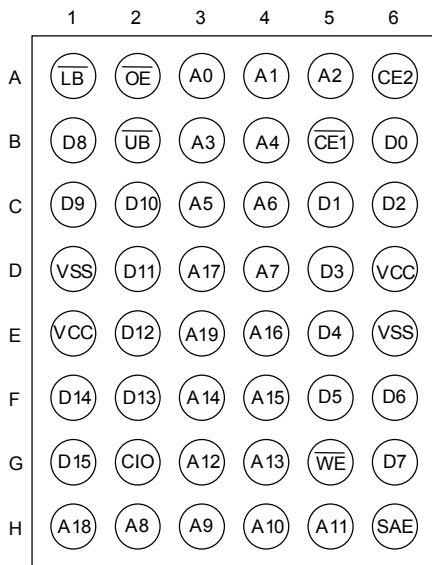

The BS616UV1620 has an automatic power down feature, reducing the power consumption significantly when chip is deselected.

The BS616UV1620 is available in DICE form and 48-pin BGA type.

■ PIN DESCRIPTIONS

| Name | Function |
|--|--|
| A0-A19 Address Input | These 20 address inputs select one of the 1,048,576 x 16-bit words in the RAM. |
| SAE Address Input | This address input incorporates with the above 20 address inputs select one of the 2,097,152 x 8-bit bytes in the RAM if the CIO is LOW. Don't use when CIO is HIGH. |
| CIO x8/x16 select input | This input selects the organization of the SRAM. 1,048,576 x 16-bit words configuration is selected if CIO is HIGH. 2,097,152 x 8-bit bytes configuration is selected if CIO is LOW. |
| $\overline{\text{CE}}1$ Chip Enable 1 Input $\overline{\text{CE}}2$ Chip Enable 2 Input | $\overline{\text{CE}}1$ is active LOW and CE2 is active HIGH. Both chip enables must be active when data read from or write to the device. If either chip enable is not active, the device is deselected and is in a standby power mode. The DQ pins will be in the high impedance state when the device is deselected. |
| $\overline{\text{WE}}$ Write Enable Input | The write enable input is active LOW and controls read and write operations. With the chip selected, when $\overline{\text{WE}}$ is HIGH and $\overline{\text{OE}}$ is LOW, output data will be present on the DQ pins; when $\overline{\text{WE}}$ is LOW, the data present on the DQ pins will be written into the selected memory location. |
| $\overline{\text{OE}}$ Output Enable Input | The output enable input is active LOW. If the output enable is active while the chip is selected and the write enable is inactive, data will be present on the DQ pins and they will be enabled. The DQ pins will be in the high impedance state when $\overline{\text{OE}}$ is inactive. |
| $\overline{\text{LB}}$ and $\overline{\text{UB}}$ Data Byte Control Input | Lower byte and upper byte data input/output control pins. The chip is deselected when both $\overline{\text{LB}}$ and $\overline{\text{UB}}$ pins are HIGH. |
| D0 - D15 Data Input/Output Ports | These 16 bi-directional ports are used to read data from or write data into the RAM. |

SWITCHING WAVEFORMS (READ CYCLE)
READ CYCLE1 (1,2,4)

READ CYCLE2 (1,3,4)

READ CYCLE3 (1,4)

NOTES:

1. \overline{WE} is high in read Cycle.
2. Device is continuously selected when $\overline{CE1} = V_{IL}$ and $CE2 = V_{IH}$.
3. Address valid prior to or coincident with $\overline{CE1}$ transition low and $CE2$ transition high.
4. $\overline{OE} = V_{IL}$.
5. Transition is measured $\pm 500\text{mV}$ from steady state with $CL = 30\text{pF}$ as shown in Figure 1B.
The parameter is guaranteed but not 100% tested.

■ SWITCHING WAVEFORMS (WRITE CYCLE)
WRITE CYCLE1 ⁽¹⁾

WRITE CYCLE2 (1,6)

NOTES:

1. \overline{WE} must be high during address transitions.
2. The internal write time of the memory is defined by the overlap of CE2, $\overline{CE1}$ and \overline{WE} low. All signals must be active to initiate a write and any one signal can terminate a write by going inactive. The data input setup and hold timing should be referenced to the second transition edge of the signal that terminates the write.
3. t_{WR} is measured from the earlier of CE2 going low, or $\overline{CE1}$ or \overline{WE} going high at the end of write cycle.
4. During this period, DQ pins are in the output state so that the input signals of opposite phase to the outputs must not be applied.
5. If the CE2 high transition or CE1 low transition or $\overline{LB}, \overline{UB}$ low transition occurs simultaneously with the \overline{WE} low transitions or after the \overline{WE} transition, output remain in a high impedance state.
6. \overline{OE} is continuously low ($\overline{OE} = V_{IL}$).
7. D_{OUT} is the same phase of write data of this write cycle.
8. D_{OUT} is the read data of next address.
9. If CE2 is high or $\overline{CE1}$ is low during this period, DQ pins are in the output state. Then the data input signals of opposite phase to the outputs must not be applied to them.
10. Transition is measured $\pm 500mV$ from steady state with $CL = 30pF$ as shown in Figure 1B. The parameter is guaranteed but not 100% tested.
11. t_{CW} is measured from the later of CE2 going high or $\overline{CE1}$ going low to the end of write.
