Product specification

20-bit bus switch with precharged outputs and Schottky undershoot protection for live insertion

CBT6820

FEATURES

- TTL compatible inputs and outputs
- 5Ω switch connection between two port A and port B
- Thin shrink small outline (TSSOP)
- Undershoot protection included to prevent shoot through level changes
- Bias voltage pre-charges the outputs to minimize signal distortion during live insertion

DESCRIPTION

The CBT6820 provides twenty bits of high-speed TTL-compatible bus switching. The low on-state resistance of the switch allows bi-directional connections to be made while adding near-zero propagation delay. The device also precharges the B port to a user-selectable bias voltage (BIASV) to minimize live-insertion noise.

The device is organized as two 10-bit switch with individual enable (OE) input. When OE is low, the switch is on and port A is connected to port B. When OE is high, the switch between port A and port B is open and the B port is precharged to BIASV through the equivalent of a 10-k Ω resistor.

Special clamp circuitry and Schottky diode clamps to ground are used to prevent an under voltage on the A side ($V_{in} < GND$) from causing the B side precharge voltage to drop below the "1" state.

NOTES:

1. All typical values are at $V_{CC} = 5\text{V}$, $T_A = 25^{\circ}\text{C}$
2. This is the increase in supply current for each input that is at the specified TTL voltage level rather than V_{CC} or GND
3. Measured by the voltage drop between the A and the B terminals at the indicated current through the switch. On-state resistance is determined by the lowest voltage of the two (A or B) terminals.
4. Force I_{USP} , measure $V_B \geq 3\text{V}$

t_{PLZ}	3-State output enable time OE to An; OE to Bn; BIASV = 3.0V	2	2.8	4.4	6.6	ns

NOTE:

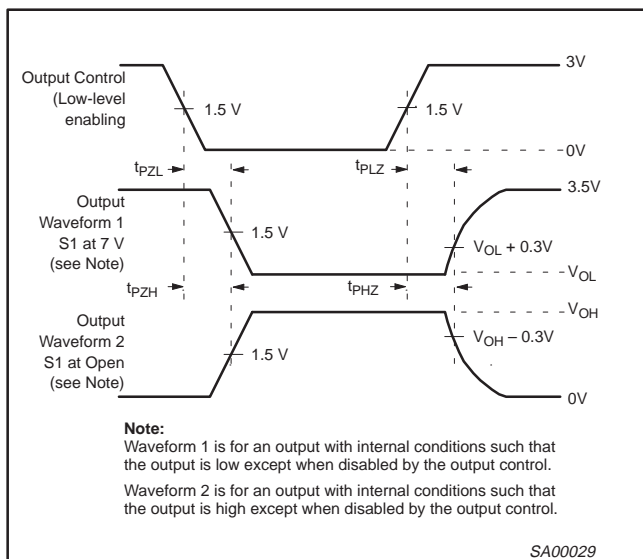

- All typical values are measured at $T_{amb} = 25^\circ C$ and $V_{CC} = 5.0V$
- Warranted but not production tested. The propagation delay is based on the RC time constant of the typical ON-state resistance of the switch and a load capacitance of 50pF, when driven by an ideal voltage source (zero output impedance)

DEFINITIONS

$C_L =$ Load capacitance includes jig and probe capacitance; see AC CHARACTERISTICS for value.

NOTES:

- All input pulses are supplied by generators having the following characteristics: $PRR \leq 10MHz$, $Z_O = 50 \Omega$, $t_r \leq 2.5 ns$, $t_f \leq 2.5 ns$.
- The outputs are measured one at a time with one transition per measurement.
