

Preliminary

GENERAL DESCRIPTION

EM73880 is an advanced single chip CMOS 4-bit micro-controller. It contains 8K-byte ROM, 244-nibble RAM, 4-bit ALU, 13-level subroutine nesting, 22-stage time base, two 12-bit timer/counters for the kernel function. EM73880 also contains 6 interrupt sources, 1 input port, 2 bidirection ports, LCD display (32x4), and one high speed timer/counter, sound generator, and speech synthesizer.

EM73880 has plentiful operating modes (SLOW, IDLE, STOP) intended to reduce the power consumption.

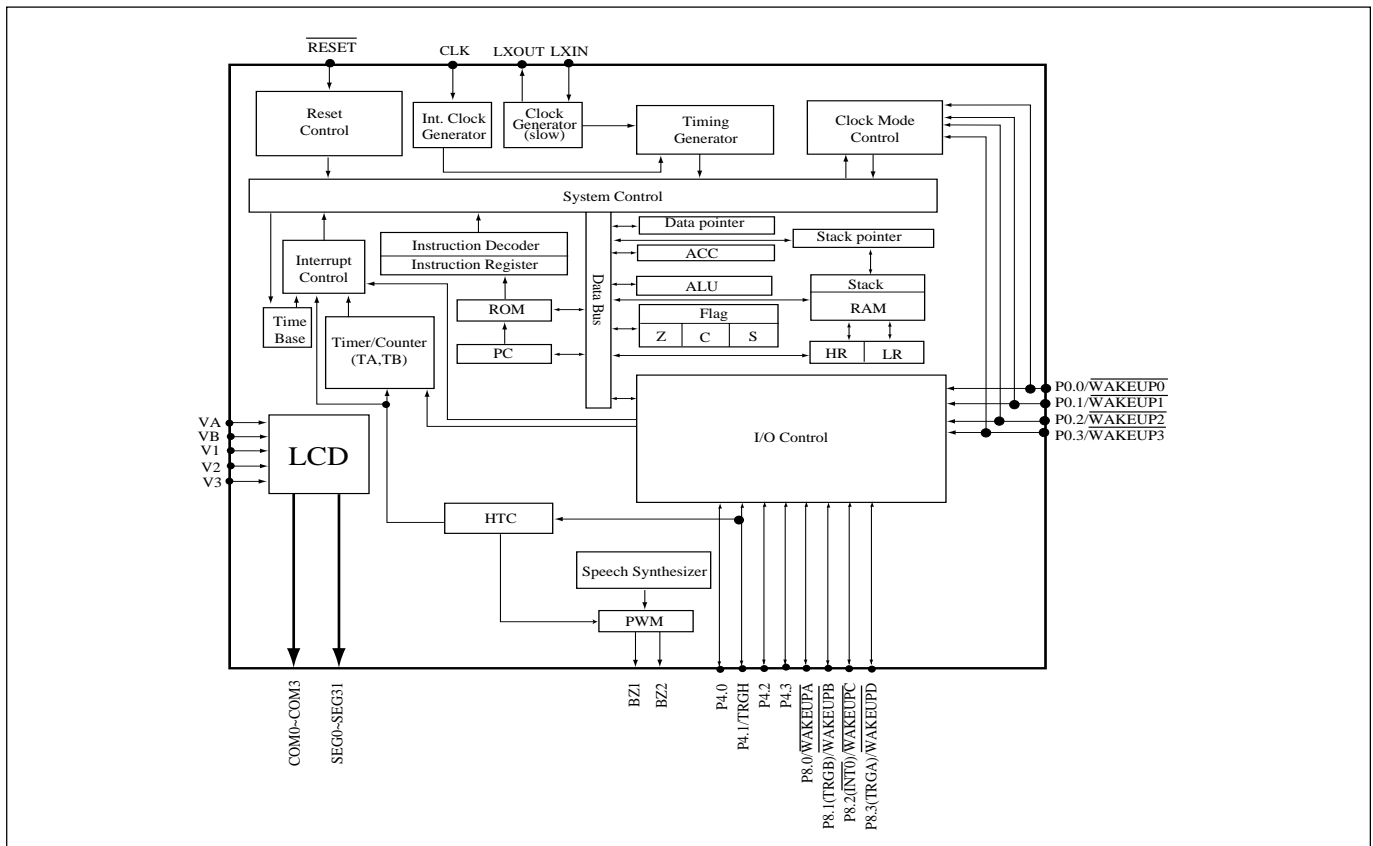

FEATURES

- Operation voltage : 2.4V to 3.6V.
- Clock source : Dual clock system. Low-frequency oscillator (32.768 KHz) could be Crystal or RC oscillator high-frequency oscillator is a built-in for 4.6 MHz.
- Instruction set : 107 powerful instructions.
- Instruction cycle time : 1.7us for 4.6 MHz (high speed clock).
244 μ s for 32768 Hz (low speed clock).
- ROM capacity : 8192 X 8 bits.
- RAM capacity : 244 X 4 bits.
- Input port : 1 port (P0). P0(0..3) and IDLE releasing function are available by mask option.
- Bidirection port : 2 ports (P4, P8). P4.1 is shared with HTC external input. P8(0..3) and IDLE releasing function are available by mask option.
- 12-bit timer/counter : Two 12-bit timer/counters are programmable for timer, event counter and pulse width measurement.
- High speed timer/counter : One 8-bit high speed timer/counters is programmable for auto load timer, melody output and pulse width measurement.
- Speech synthesizer : 160K Speech ROM.
- Built-in time base counter : 22 stages.
- Subroutine nesting : Up to 13 levels.
- Interrupt : External 1 input interrupt sources.
Internal 2 Timer overflow interrupts, 1 time base interrupt.
1 high speed timer/counter overflow interrupt.
1 Speech ending interrupt.
- LCD driver : 32 X 4 dots, 1/4, 1/3, 1/2, static 4 kinds of duty Type selectable, 1/2 bias, 1/3 bias, 2 kinds bias Type selectable.
- Power saving function : SLOW, IDLE, STOP operation mode.
- Package type : Chip form.63 pins.

APPLICATIONS

EM73880 is suitable for application in family appliance, consumer products, hand held games and the toy controller.

Preliminary

FUNCTION BLOCK DIAGRAM

PIN DESCRIPTIONS

Symbol	Pin-type	Function
V_{DD}, V_{DD2}		Power supply (+) / speech synthesizer power supply(+)
V_{SS}		Power supply (-)
RESET	RESET-A	System reset input signal, low active mask option : none pull-up
CLK	OSC-G	Capacitor connecting pin for internal high frequency OSC.
LXIN	OSC-B/OSC-H	Crstal/RC connecting pin for low speed clock source
LXOUT	OSC-B	Crstal/RC connecting pin for low speed clock source
P0(0..3)/WAKEUP0..3	INPUT-K	4-bit input port with IDLE releasing function mask option : wakeup enable, negative edge release, pull-up wakeup enable, negative edge release, none wakeup enable, positive edge release, pull-down wakeup enable, positive edge release, none wakeup disable, pull-up wakeup disable, pull-down wakeup disable, none
P4.0	I/O-R	1-bit bidirection I/O port

Preliminary

PIN DESCRIPTIONS

Symbol	Pin-type	Function
P4.1/TRGH	I/O-Q	1-bit bidirection I/O port with HTC external input mask option : NMOS open-drain PMOS open-drain low current push-pull normal current push-pull high current push-pull
P4(2,3)	I/O-Q	2-bit bidirection I/O port with high current source mask option : NMOS open-drain PMOS open-drain low current push-pull normal current push-pull high current push-pull
P8.0/WAKEUPA, P8.2/INT0/WAKEUPC	I/O-S	2-bit bidirection I/O port with external interrupt source input only P8.2 and IDLE releasing function mask option : wakeup enable, low current push-pull wakeup enable, normal current push-pull wakeup disable, open-drain wakeup disable, low current push-pull wakeup disable, normal current push-pull
P8.1(TRGB)/WAKEUPB P8.3(TRGA)/WAKEUPD	I/O-S	2-bit bidirection I/O port with time/counter A,B external input and IDLE releasing function mask option : wakeup enable, low current push-pull wakeup enable, normal current push-pull wakeup disable, open-drain wakeup disable, low current push-pull wakeup disable, normal current push-pull
BZ1, BZ2		Speech output pin
VA,VB, V1, V2, V3		Connect the capacitors for LCD bias voltage
COM0~COM3		LCD common output pins
SEG0~SEG31		LCD segment output pins
TEST		Tie Vss as package type, no connecting as COB type

FUNCTION DESCRIPTIONS

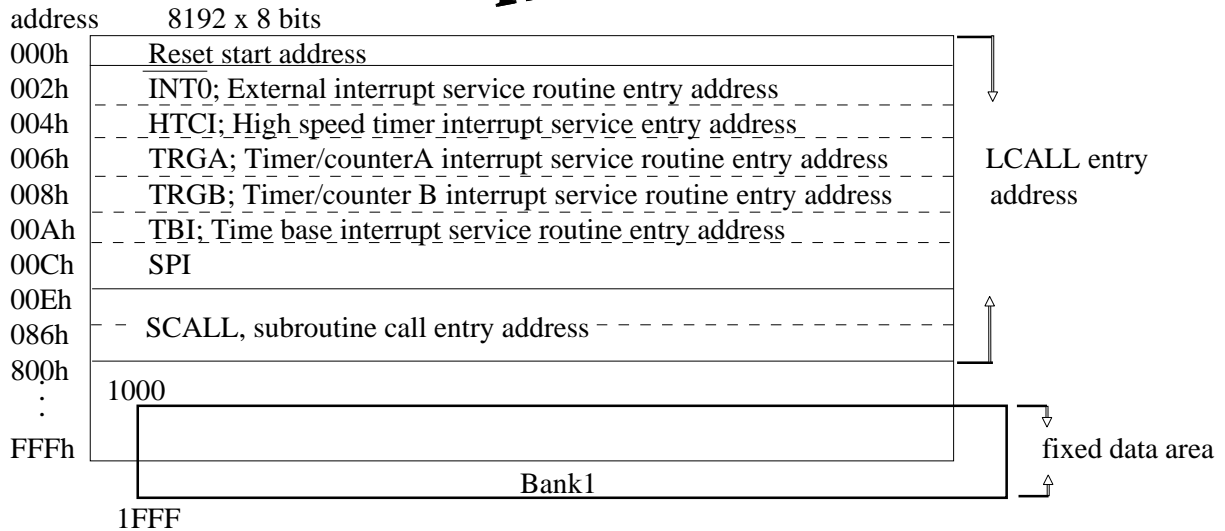

PROGRAM ROM (8K X 8 bits)

8 K x 8 bits program ROM contains user's program and some fixed data.

The basic structure of program ROM can be divided into 6 parts.

1. Address 000h: Reset start address.
2. Address 002h - 00Ch : 6 kinds of interrupt service routine entry addresses.
3. Address 00Eh-086h : SCALL subroutine entry address, only available at 00Eh,016h,01Eh,026h, 02Eh, 036h, 03Eh, 046h, 04Eh, 056h, 05Eh, 066h, 06Eh, 076h, 07Eh, 086h.
4. Address 000h - 7FFh : LCALL subroutine entry address
5. Address 000h - 1FFFh : Except used as above function, the other region can be used as user's program region.
6. Address 1000h - 1FFFh : Fixed data storage area.

Preliminary

User's program and fixed data are stored in the program ROM. User's program is according the PC value to send next executed instruction code . Fixed data can be read out.
The program counter is a 13-bit binary counter. The PC can defined 8K ROM.

Table -look-up instruction is depended on the Data Pointer (DP) to indicate to ROM address, then to get the ROM code data. The fixed data only can be put in bank1.

LDAX **Acc ← ROM[DP]_L**
LDAXI **Acc ← ROM[DP]_H, DP+1**

DP is a 12-bit data register which can store the program ROM address to be the pointer for the ROM code data. First, user load ROM address into DP by instruction "STADPL, STADPM, STADPH", then user can get the lower nibble of ROM code data by instruction "LDAX" and higher nibble by instruction "LDAXI"

PROGRAM EXAMPLE: Read out the ROM code of address 1777h by table-look-up instruction.

```
LDIA #07h;
STADPL ; DP2-0 ← 07h
STADPM ; DP5-3 ← 07h
STADPH ; DP8-6 ← 07h, Load DP=777h
:
LDL #00h;
LDH #03h;
LDAX ; ACC ← 6h
STAMI ; RAM[30] ← 6h
LDAXI ; ACC ← 5h
STAM ; RAM[31] ← 5h
;
ORG 1777H
DATA 56H;
:
```

DATA RAM (244-nibble)

There is total 244 - nibble data RAM from address 00 to F3h
Data RAM includes 3 parts: zero page region, stacks and data area.

Preliminary

LCD display RAM:

RAM address from 20h ~ 3Fh are the LCD display RAM area, the RAM data of this region can't be operated by instruction LDHL xx and EXHL.

ZERO- PAGE:

From 00h to 0Fh is the location of zero-page . It is used as the pointer in zero -page addressing mode for the instruction of "STD #k,y; ADD #k,y; CLR y,b; CMP k,y".

PROGRAM EXAMPLE: To wirte immediate data "07h" to address "03h" of RAM and to clear bit 2 of RAM.

```
STD #07h, 03h ; RAM[03] ← 07h
CLR 0Eh,2 ; RAM[0Eh]2 ← 0
```

STACK:

There are 13 - level (maximum) stack for user using for subroutine (including interrupt and CALL). User can assign any level be the starting stack by giving the level number to stack pointer (SP).

When user using any instruction of CALL or subroutine, before entry the subroutine, the previous PC address will be saved into stack until return from those subroutines ,the PC value will be restored by the data saved in stack.

DATA AREA:

Except the special area used by user, the whole RAM can be used as data area for storing and loading general data.

ADDRESSING MODE

(1) Indirect addressing mode:

Indirect addressing mode indicates the RAM address by specified HL register.

```
For example: LDAM ; Acc ← RAM[HL]
             STAM ; RAM[HL] ← Acc
```

(2) Direct addressing mode:

Direct addressing mode indicates the RAM address by immediate data.

Preliminary

For example: LDA x ; Acc ← RAM[x]
STA x ; RAM[x] ← Acc

(3) Zero-page addressing mode

For zero-page region, user can using direct addressing to write or do any arithmetic, comparison or bit manipulated operation directly.

For example: STD #k,y ; RAM[y] ← #k
ADD #k,y ; RAM[y] ← RAM[y] + #k

PROGRAM COUNTER (8K ROM)

Program counter (PC) is composed by a 13-bit counter, which indicates the next executed address for the instruction of program ROM.

For a 8K - byte size ROM, PC can indicate address form 0000h - 1FFFh, for BRANCH and CALL instrcutions, PC is changed by instruction indicating.

(1) Branch instruction:

SBR a

Object code: 00aa aaaa

Condition: SF=1; PC ← PC_{11-6,a} (branch condition satisfied)

SF=0; PC ← PC + 1 (branch condition not satisfied)

LBR a

Object code: 1100 aaaa aaaa aaaa

Condition: SF=1; PC ← a (branch condition satisfied)

SF=0 ; PC ← PC + 2 (branch condition not satisfied)

Preliminary

(2) Subroutine instruction:

SCALL a

Object code: 1110 nnnn

Condition : $PC \leftarrow a$; $a=8n+6$; $n=1..15$; $a=86h$, $n=0$

PC

0	0	0	0	a	a	a	a	a	a	a	a
---	---	---	---	---	---	---	---	---	---	---	---

LCALL a

Object code: 0100 0 aaa aaaa aaaa

Condition: $PC \leftarrow a$

PC

0	a	a	a	a	a	a	a	a	a	a	a
---	---	---	---	---	---	---	---	---	---	---	---

RET

Object code: 0100 1111

Condition: $PC \leftarrow STACK[SP]$; $SP + 1$

PC

The return address stored in stack											
------------------------------------	--	--	--	--	--	--	--	--	--	--	--

RTI

Object code: 0100 1101

Condition : FLAG. $PC \leftarrow STACK[SP]$; $EI \leftarrow 1$; $SP + 1$

PC

The return address stored in stack											
------------------------------------	--	--	--	--	--	--	--	--	--	--	--

Preliminary

(3) Interrupt acceptance operation:

When an interrupt is accepted, the original PC is pushed into stack and interrupt vector will be loaded into PC, The interrupt vectors are as following:

INT0 (External interrupt from P8.2)

PC

0	0	0	0	0	0	0	0	0	0	0	1	0
---	---	---	---	---	---	---	---	---	---	---	---	---

HTC (High speed counter)

PC

0	0	0	0	0	0	0	0	0	0	1	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

TRGA (Timer A overflow interrupt)

PC

0	0	0	0	0	0	0	0	0	0	1	1	0
---	---	---	---	---	---	---	---	---	---	---	---	---

TRGB (Time B overflow interrupt)

PC

0	0	0	0	0	0	0	0	1	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

TBI (Time base interrupt)

PC

0	0	0	0	0	0	0	0	1	0	1	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

SPI (Speech Interrupt)

PC

0	0	0	0	0	0	0	0	1	1	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

(4) Reset operation:

PC

0	0	0	0	0	0	0	0	0	0	0	0	0
---	---	---	---	---	---	---	---	---	---	---	---	---

(5) Other operations:

- For 1-byte instruction execution: PC + 1
- For 2-byte instruction execution: PC + 2
- For 3-byte instruction execution: PC + 3

ACCUMULATOR

Accumulator is a 4-bit data register for temporary data . For the arithmetic, logic and comparative operation ..., ACC plays a role which holds the source data and result .

Preliminary

FLAGS

There are three kinds of flag, CF (Carry flag), ZF (Zero flag), SF (Status flag), these 3 1-bit flags are affected by the arithmetic, logic and comparative operation .

All flags will be put into stack when an interrupt subroutine is served, and the flags will be restored after RTI instruction executed .

(1) Carry Flag (CF)

The carry flag is affected by following operation:

- a. Addition : CF as a carry out indicator, when the addition operation has a carry-out, CF will be "1", in another word, if the operation has no carry-out, CF will be "0".
- b. Subtraction : CF as a borrow-in indicator, when the subtraction operation must has a borrow, in the CF will be "0", in another word, if no borrow-in, CF will be "1".
- c. Comparision: CF is as a borrow-in indicator for Comparision operation as the same as subtraction operation.
- d. Rotation: CF shifts into the empty bit of accumulator for the rotation and holds the shift out data after rotation.
- e. CF test instruction : For TFCFC instruction, the content of CF sends into SF then clear itself "0".
For TTSFC instruction, the content of CF sends into SF then set itself "1".

(2) Zero Flag (ZF)

ZF is affected by the result of ALU, if the ALU operation generate a "0" result, the ZF will be "1", otherwise, the ZF will be "0".

(3) Status Flag (SF)

The SF is affected by instruction operation and system status .

- a. SF is initiated to "1" for reset condition .
- b. Branch instruction is decided by SF, when SF=1, branch condition will be satisfied, otherwise, branch condition will not be satisfied by SF = 0 .

PROGRAM EXAMPLE:

Check following arithmetic operation for CF, ZF, SF

	CF	ZF	SF
LDIA #00h;	-	1	1
LDIA #03h;	-	0	1
ADDA #05h;	-	0	1
ADDA #0Dh;	-	0	0
ADDA #0Eh;	-	0	0

Preliminary

ALU

The arithmetic operation of 4 - bit data is performed in ALU unit. There are 2 flags can be affected by the result of ALU operation, ZF and SF . The operation of ALU can be affected by CF only .

ALU STRUCTURE

ALU supported user arithmetic operation function, including : addition, subtraction and rotaion.

ALU FUNCTION

(1) Addition:

For instruction ADDAM, ADCAM, ADDM #k, ADD #k,y ALU supports addition function. The addition operation can affect CF and ZF. For addition operation, if the result is "0", ZF will be "1", otherwise, not equal "0", ZF will be "0", When the addition operation has a carry-out. CF will be "1", otherwise, CF will be "0".

EXAMPLE:

Operation	Carry	Zero
3+4=7	0	0
7+F=6	1	0
0+0=0	0	1
8+8=0	1	1

(2) Subtraction:

For instruction SUBM #k, SUBA #k, SBCAM, DECM... ALU supports user subtraction function . The subtraction operation can affect CF and ZF, For subtraction operation, if the result is negative, CF will be "0", it means a borrow out, otherwise, if the result is positive, CF will be "1". For ZF, if the result of subtraction operation is "0", the ZF will be "1", otherwise, ZF will be "1".

EXAMPLE:

Operation	Carry	Zero
8-4=4	1	0
7-F= -8(1000)	0	0
9-9=0	1	1

Preliminary

(3) Rotation:

There are two kinds of rotation operation, one is rotation left, the other is rotation right.
 RLCA instruction rotates Acc value to left, shift the CF value into the LSB bit of Acc and the shift out data will be hold in CF.

RRCA instruction operation rotates Acc value to right, shift the CF value into the MSB bit of Acc and the shift out data will be hold in CF.

PROGRAM EXAMPLE: To rotate Acc right and shift a "1" into the MSB bit of Acc .

TTCFS; CF ← 1

RRCA; rotate Acc right and shift CF=1 into MSB.

HL REGISTER

HL register are two 4-bit registers, they are used as a pair of pointer for the address of RAM memory and also 2 independent temporary 4-bit data registers. For some instruction, L register can be a pointer to indicate the pin number (Port4) .

HL REGISTER STRUCTURE

Preliminary**HL REGISTER FUNCTION**

- (1) For instruction : LDL #k, LDH #k, THA, THL, INCL, DECL, EXAL, EXAH, HL register used as a temporary register .

PROGRAM EXAMPLE: Load immediate data "5h" into L register, "Dh" into H register.

LDL #05h;

LDH #0Dh;

- (2) For instruction LDAM, STAM, STAMI .., HL register used as a pointer for the address of RAM memory.

PROGRAM EXAMPLE: Store immediate data #Ah into RAM of address 35h.

LDL #5h;

LDH #3h;

STDMI #0Ah; RAM[35] ← Ah

- (3) For instruction : SELP, CLPL, TFPL, L register be a pointer to indicate the bit of I/O port.

When LR = 0 indicate P4.0

PROGRAM EXAMPLE: To set bit 0 of Port4 to "1"

LDL #00h;

SEPL ; P4.0 ← 1

STACK POINTER (SP)

Stack pointer is a 4-bit register which stores the present stack level number.

Before using stack, user must set the SP value first, CPU will not initiate the SP value after reset condition

. When a new subroutine is accepted, the SP will be decreased one automatically, in another word, if returning from a subroutine, the SP will be increased one .

The data transfer between ACC and SP is by instruction of "LDASP" and "STASP".

DATA POINTER (DP)

Data pointer is a 12-bit register which stores the address of ROM can indicate the ROM code data specified by user (refer to data ROM).

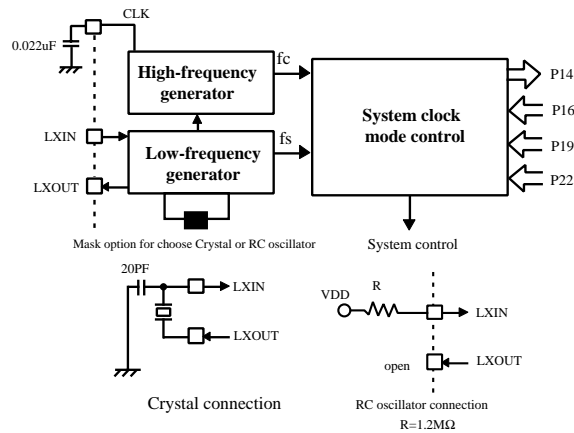

CLOCK AND TIMING GENERATOR

The clock generator is supported by a dual clock system, the slow clock source comes from crystal (resonator) or RC oscillation is decided by mask option, and it's 32.768 KHz. The high freq OSC is built by a internal clock source that will be 4.6 MHz.

CLOCK GENERATOR STRUCTURE

There are two clock generator for system clock control. P14 is the status register for the CPU status. P16, P19 and P22 are the system clock mode control ports.

Preliminary

SYSTEM CLOCK MODE CONTROL

The system clock mode controller can start or stop the high-frequency and low-frequency clock oscillator and switch between the basic clocks. EM73880 has four operation modes (NORMAL, SLOW, IDLE and STOP operation modes).

Operation Mode	Oscillator	System Clock	Available function	One instruction cycle
NORMAL	High, Low frequency	High frequency clock	LCD, HST, Speech sound	8 / fc
SLOW	Low frequency	Low frequency clock	LCD, HST	8 / fs
IDLE	Low frequency	CPU stops	LCD	-
STOP	None	CPU stops	All disable	-

Preliminary

NORMAL OPERATION MODE

The 4-bit μ c is in the NORMAL operation mode when the CPU is reseted. This mode is a dual clock system (high-frequency and low-frequency clocks oscillating). It can be changed to SLOW or STOP operation mode by the command register (P22 or P16).

LCD display and high speed timer/counter with melody output are available for the NORMAL operation mode.

SLOW OPERATION MODE

The SLOW operation mode is a single clock system (low-frequency clock oscillating). It can be changed to the DUAL operation mode with the commoand register (P22), STOP operation mode with P16 and IDLE operation mode with P19.

LCD display and high speed timer/counter with melody output are available for the SLOW operation mode.

SOM	Select operation mode
0 0 0	NORMAL operation mode
1 * *	SLOW operation mode

LFS	Low-frequency status	CPUS	CPU status
0	LXIN source is not stable	0	NORMAL operation mode
1	LXIN source is stable	1	SLOW operation mode

WKS	Wakeup status
0	Wakeup not by internal timer
1	Wakeup by internal timer

Port14 is the status register for CPU. P14.0 (CPU status) and P14.1 (Low-frequency status) are read-only bits. p14.2 (wakeup status) will be set to '1' when CPU is wake-up by internal timer. P14.2 will be cleared to '0' when user out data to P14.

IDLE OPERATION MODE

The IDLE operation mode suspends all SLOW operations except for the low-frequency clock and LCD driver. It retains the internal status with low power consumption without stopping the clock function and LCD display.

LCD display is available for the IDLE operation mode. Sound generator is disabled in this mode. The IDLE operation mode will be wakeup and return to the SLOW operation mode by the internal timing generator or I/O pins (P0(0..3)/WAKEUP 0..3 or P8(0..3)/WAKEUPA..D).

Preliminary

P19 3 2 1 0 Initial value : 0000

IDME	SIDR
------	------

IDME	Enable IDLE mode
0 1	Enable IDLE mode
* *	Reserved

SIDR	Select IDLE releasing condition
0 0	P0(0..3), P8(0..3) pin input
0 1	P0(0..3), P8(0..3) pin input and 1 sec signal
1 0	P0(0..3), P8(0..3) pin input and 0.5 sec signal
1 1	P0(0..3), P8(0..3) pin input and 15.625 ms signal

STOP OPERATION MODE

The STOP operation mode suspends system operation and holds the internal status immediately before the suspension with low power consumption. This mode will be released by reset or I/O pins (P0(0..3)/WAKEUP 0..3 or P8(0..3)/WAKEUP A..D).

LCD display and high speed timer/counter with melody output are disabled in the mode.

P16 3 2 1 0 Initial value : 0000

SPME	SWWT
------	------

SPME	Enable STOP mode
0 1	Enable STOP mode
* *	Reserved

SWWT	Set wake-up warm-up time
0 0	$2^{12}/f_s$
0 1	$2^{10}/f_s$
1 0	$2^{14}/f_s$
1 1	Reserved

TIME BASE INTERRUPT (TBI)

The time base can be used to generate a fixed frequency interrupt. There are 8 kinds of frequencies can be selected by setting P25

P25 3 2 1 0 initial value : 0000

P25	NORMAL operation mode	SLOW operation mode
0 0 x x	Interrupt disable	Interrupt disable
0 1 0 0	Interrupt frequency LXIN / 2^3 Hz	Reserved
0 1 0 1	Interrupt frequency LXIN / 2^4 Hz	Reserved
0 1 1 0	Interrupt frequency LXIN / 2^5 Hz	Reserved
0 1 1 1	Interrupt frequency LXIN / 2^{14} Hz	Interrupt frequency LXIN / 2^{14} Hz
1 1 0 0	Interrupt frequency LXIN / 2^1 Hz	Reserved
1 1 0 1	Interrupt frequency LXIN / 2^6 Hz	Interrupt frequency LXIN / 2^6 Hz
1 1 1 0	Interrupt frequency LXIN / 2^8 Hz	Interrupt frequency LXIN / 2^8 Hz
1 1 1 1	Interrupt frequency LXIN / 2^{10} Hz	Interrupt frequency LXIN / 2^{10} Hz
1 0 x x	Reserved	Reserved

TIMER / COUNTER (TIMER A, TIMER B)

Timer/counters can support user three special functions:

1. Even counter
2. Timer.
3. Pulse-width measurement.

Preliminary

These three functions can be executed by 2 timer/counter independently.

For timerA, the counter data is saved in timer register TAH, TAM, TAL, which user can set counter initial value and read the counter value by instruction "LDATAH(M,L), STATAH(M,L)" and timer register is TBH, TBM, TBL and W/R instruction "LDATBH (M,L), STATBH (M,L)".

The basic structure of timer/counter is composed by two same structure counter, these two counters can be set initial value and send counter value to timer register, P28 and P29 are the command ports for timerA and timer B, user can choose different operation mode and different internal clock rate by setting these two ports. When timer/counter overflow, it will generate a TRGA(B) interrupt request to interrupt control unit.

TIMER/COUNTER CONTROL

P8.1/TRGB, P8.3/TRGA are the external timer inputs for timerB and timerA, they are used in event counter and pulse-width measurement mode.

Timer/counter command port: P28 is the command port for timer/counterA and P29 is for the timer/counterB.

Port 28

3	2	1	0
TMSA	IPSA		

Initial state: 0000

Port 29

3	2	1	0
TMSB	IPSB		

Initial state: 0000

TIMER/COUNTER MODE SELECTION	
TMSA (B)	Function description
0 0	Stop
0 1	Event counter mode
1 0	Timer mode
1 1	Pulse width measurement mode

INTERNAL PULSE-RATE SELECTION		
IPSA	NORMAL mode	SLOW mode
0 0	LXIN/2 ³ Hz	Reserved
0 1	LXIN/2 ⁷ Hz	LXIN/2 ⁷ Hz
1 0	LXIN/2 ¹¹ Hz	LXIN/2 ¹¹ Hz
1 1	LXIN/2 ¹⁵ Hz	LXIN/2 ¹⁵ Hz

INTERNAL PULSE-RATE SELECTION		
IPSB	NORMAL mode	SLOW mode
0 0	Depend on high speed timer/counter	
0 1	LXIN/2 ⁵ Hz	LXIN/2 ⁵ Hz
1 0	LXIN/2 ⁹ Hz	LXIN/2 ⁹ Hz
1 1	LXIN/2 ¹³ Hz	LXIN/2 ¹³ Hz

Preliminary

TIMER/COUNTER FUNCTION

Timer/counterA can be programmable for timer, event counter and pulse width measurement. Each timer/counter can execute any one of these functions independently.

EVENT COUNTER MODE

For event counter mode, timer/counter increases one at any rising edge of P8.1/TRGB for timerB (P8.3/TRGA for timer A). When timerB (timerA) counts overflow, it will give interrupt control an interrupt request TRGB (TRGA).

PROGRAM EXAMPLE: Enable timerA with P28

```
LDIA #0100B;
```

```
OUTA P28; Enable timerA with event counter mode
```

TIMER MODE

For timer mode, timer/counter increase one at any rising edge of internal pulse. User can choose 4 kinds of internal pulse rate by setting IPSB for timerB (IPSA for timerA).

When timer/counter counts overflow, TRGB (TRGA) will be generated to interrupt control unit.

PROGRAM EXAMPLE: To generate TRGA interrupt request after 60 ms with system clock LXIN=32KHz

```
LDIA #0100B;
```

```
EXAE; enable mask 2
```

```
EICIL 110111B; interrupt latch ←0, enable EI
```

```
LDIA #0AH;
```

```
STATAL;
```

```
LDIA #00H;
```

```
STATAM;
```

```
LDIA #0FH;
```

```
STATAH;
```

```
LDIA #1000B;
```

```
OUTA P28; enable timerA with internal pulse rate: LXIN/23 Hz
```

NOTE: The preset value of timer/counter register is calculated as following procedure.

Internal pulse rate: $LXIN/2^3$; $LXIN = 32KHz$

The time of timer counter count one = $2^3 / LXIN = 8/32768=0.244ms$

The number of internal pulse to get timer overflow = $60 ms / 0.244ms = 245.901 = 0F6H$

The preset value of timer/counter register = $1000H - 0F6H = 0F0AH$

PULSE WIDTH MEASUREMENT MODE

Preliminary

For the pulse width measurement mode, the counter only increased by the rising edge of internal pulse rate as external timer/counter input (P8.1/TRGB, P8.3/TRGA), interrupt request will be generated as soon as timer/counter count overflow.

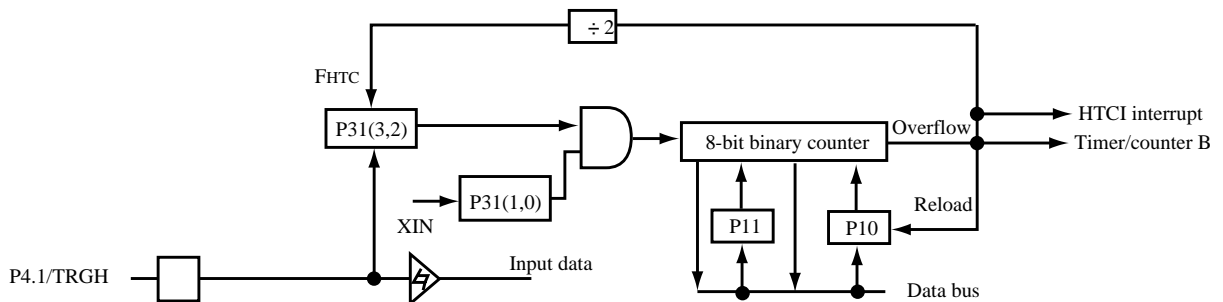

PROGRAM EXAMPLE : Enable timerA by pulse width measurement mode .
 LDIA #1100b;
 OUTA P28; Enable timerA with pulse width measurement mode.

HIGH SPEED TIMER/COUNTER

8-bit high speed timer/counter (HTC) supports three special functions : auto load timer, melody output and pulse width measurement modes. The HTC is available for the NORMAL and SLOW operation mode.

The HTC can be set initial value and send counter value to counter registers (P11 and P10), P31 is the command port for HTC, user can choose different operation mode and different internal clockrate by setting the port. The timer/counter increase one at the rising edge of internal pulse. The HTC can generate an overflow interrupt (HTCI) when it overflows.

P31 is the command register of the 8-bit high speed timer/counter.

P31 3 2 1 0 Initial value : 0000

HTMS	HIPS
------	------

HTMS	Mode selection
0 0	Stop
0 1	Event counter mode
1 0	Auto load timer mode
1 1	Pulse width measurement mode

HIPS	Clock rate selection	
	NORMAL mode	SLOW mode
0 0	LXIN/2 ⁰ Hz	LXIN/2 ⁰ Hz
0 1	LXIN/2 ² Hz	LXIN/2 ² Hz
1 0	CLK/2 ⁴ Hz	Reserved
1 1	CLK/2 ⁶ Hz	Reserved

* CLK=4.6MHz

P11 and P10 are the counter registers of the 8-bit high speed timer/counter. P10 is the lower nibble register and P11 is the higher nibble register. (HT is the value of counter registers.)

P11 3 2 1 0 P10 3 2 1 0 Initial value : 0000 0000 (HT)

Higher nibble register

Lower nibble register

Preliminary

The value of 8-bit binary up counter can be presetted by P10 and P11. The value of registers can loaded into the HTC when the counter starts counting or occurs overflow. If user write value to the registers before the next overflow occurs, the preset value can be changed.

The preset value will be changed when users output the different data to P10. Thus, the data must be output to P11 before P10 when users want to change the preset value.

The count value of HTC can be read from P10 and P11. The value is unstable when user read the value during counting. Thus, user must disable the counter before reading the value.

The P4.1/RGH pin will be the input pin in the event counter and pulse width measurement mode. User must output high to P4. 1/TRGH and then it can be the HTC external input pin. When the HTC is disabled, the P4. 1 pin is a normal I/O pin.

INTERRUPT FUNCTION

There are 6 interrupt sources, 2 external interrupt sources, 4 internal interrupt sources . Multiple interrupts are admitted according the priority .

Type	Interrupt source	Priority	Interrupt Latch	Interrupt Enable condition	Program ROM entry address
External	External interrupt($\overline{INT0}$)	1	IL5	EI=1	002H
Internal	High speed timer overflow interrupt (HTCI)	2	IL4	EI=1, MASK3=1	004H
Internal	TimerA overflow interrupt (TRGA)	3	IL3	EI=1, MASK2=1	006H
Internal	TimerB overflow interrupt (TRGB)	4	IL2	EI=1, MASK1=1	008H
Internal	Time base interrupt(TBI)	5	IL1		00AH
Internal	SPI (Speech interrupt)	6	IL0	EI=1, MASK0=1	00CH

INTERRUPT STRUCTURE

Preliminary

Interrupt controller:

- IL0-IL5 : Interrupt latch . Hold all interrupt requests from all interrupt sources. ILr can not be set by program, but can be reset by program or system reset, so IL only can decide which interrupt source can be accepted.
- MASK0-MASK3 : Except $\overline{\text{INT0}}$,MASK register can permit or inhibit all interrupt sources.
- EI : Enable interrupt Flip-Flop can permit or inhibit all interrupt sources, when interrupt happened, EI is cleared to "0" automatically, after RTI instruction happened, EI will be set to "1" again .

Priority checker: Check interrupt priority when multiple interrupts happened.

INTERRUPT FUNCTION

The procedure of interrupt operation:

1. Push PC and all flags to stack.
2. Set interrupt entry address into PC.
3. Set SF= 1.
4. Clear EI to inhibit other interrupts happened.
5. Clear the IL for which interrupt source has already be accepted.
6. To excute interrupt subroutine from the interrupt entry address.
7. CPU accept RTI, restore PC and flags from stack . Set EI to accept other interrupt requests.

PROGRAM EXAMPLE: To enable interrupt of "INT0, TRGA"

```
LDIA #1100B;  
EXAE; set mask register "1100B"  
EICIL 111111B ; enable interrupt F.F.
```

SPEECH SYNTHESIZER OPERATES PROCEDURE

1. Send the speech start address to the address latch by writing P6 four times.
2. Choose the sampling rate, enable the speech synthesizer by writing P5.
3. The ROM address counters send the ROM address A6 .. A18 to the speech ROM.
4. ACT is the speech acknowledge signal. When the speech synthesizer has voice output. ACT is high . When ACT is changed from high to low, the speech synthesizer can generate the speech ending interrupt SPI. The ACT signal can be read from P5.3.

Preliminary

SPEECH SYNTHESIZER CONTROL

Speech sample rate control register (P5 write) :
Initial value : *000

SR	Sample rate selection	Sample rate
000	PWM on	CLK/64/1/3 24K
001		CLK/64/1/4 18K
010		CLK/64/2/3 12K
011		CLK/64/2/4 9K
100		CLK/64/3/3 8K
101		CLK/64/3/4 6K
111		PWM off

port 5 -- initialization is "*111".
port 6 -- initialization is pointed to the low-nibble of start address latch.

CLK=4.6 MHz

SINT	Select interrupt source
0	Select HTC overflow interrupt
1	Select speech ending interrupt

Speech active flag (P5 read) :
Initial value : 0***

ACT is the speech acknowledge signal. When the speech synthesizer has voice output, ACT is high. When ACT is high → low, the speech synthesizer can generate the speech ending interrupt SPI, or when HTC overflow interrupt SPI.

Speech start address register (P6 write) :

P6L1	P6L2	P6L3	P6L4
A9 A8 A7 A6	A13 A12 A11 A10	A17 A16 A15 A14	- - - -

Send the speech start address to the speech synthesizer by writing P6 four times. There is a pointer counter to point the address latch (P6L1, P6L2, P6L3, P6L4). It will increase one when write P6. So, the first time writing P6 to P6L1, the second time is P6L2, the third time is P6L3, the fourth time is P6L4 and the fifth time is P6L1 latch again, ... etc. The pointer counter point to P6L1 when CPU is reset or P5 is written. In the NORMAL operation mode, the speech synthesizer is available. In the other operation modes, it is disable.

MELODY (SOUND EFFECT) CONTROL

One channel melody/sound effect output, controlled by port 23, 24, 17, and 30.

There is a built-in sound effect. It includes the tone generator and random generator. The tone generator is a binary down counter and the random generator is a 9-bit liner feedback shift register.

Sound effect command register (P30)

There are 4 kinds of basic frequency for sound generator which can be selected by P30. The output of sound effect is tone and random combination.

Initial value : 0000

BFREQ	Basic frequency (f1) select
0 0	CLK/4
0 1	CLK/8
1 0	CLK/16
1 1	CLK/32

(CLK=4.6MHz)

SMODE	Sound generator mode
0 0	Disable
0 1	Tone output
1 0	Random output
1 1	Tone+random output

Tone frequency register (P23, P24)

The 8-bit tone frequency register is P24 and P23. The tone frequency will be changed when user output the different data to P23. Thus, the data must be output to P24 before P23 when users want to change the 8-bit tone frequency (TF).

Initial value : 1111 1111

** $f1=CLK/2^x$, $f2=f1/(TF+1)/2$, $TF=1\sim255$, $TF\neq0$

** Example : CLK=4.6 MHz, BFREQ=11, TF=00110001B.

⇒ $f1=143.75K$ Hz, $f2=143.75K$ Hz/50/2=1430 Hz

Preliminary

Random generator

$$f(x) = x^9 + x^4 + 1$$

Volume control register (P17)

The are 16 levels of volume for sound generator. P17 is the volume control register.

Initial value : 1111

VCR				ts/tp
1	1	1	1	15/16
1	1	1	0	14/16
:				:
0	0	0	1	1/16
0	0	0	0	0/16

PROGRAM EXAMPLE:

```

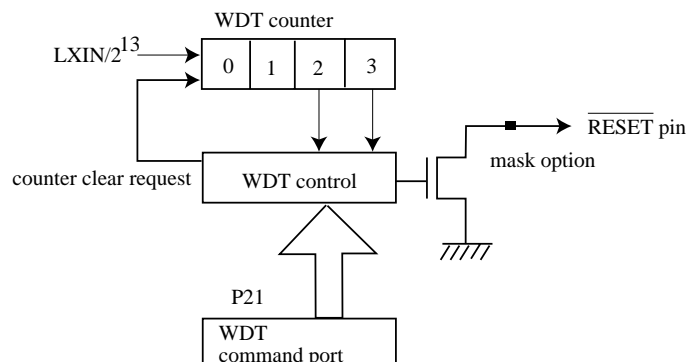

LDIA    #1101B           ; basic frequency : CLK/32, tone output
OUTA    P30
LDIA    #0111B           ; volume control
OUTA    P17
LDIA    #0011B           ; 1430 Hz tone output
OUTA    P24
LDIA    #0001B
OUTA    P23
    
```

WATCH-DOG-TIMER (WDT)

Watch-dog-timer can help user to detect the malfunction (runaway) of CPU and give system a timeup signal every certain time . User can use the time up signal to give system a reset signal when system is fail.

This function is available by mask option. If the mask option of WDT is enabled, it will stop counting when CPU is reseted or in the STOP operation mode.

The basic structure of Watch-Dog-Timer control is composed by a 4-stage binary counter and a control unit . The WDT counter counts for a certain time to check the CPU status, if there is no malfunction happened, the counter will be cleared and continue counting . Otherwise, if there is a malfunction happened, the WDT control will send a WDT signal (low active) to reset CPU. The WDT checking period is assign by P21 (WDT command port) .

Preliminary

P21 is the control port of watch-dog-timer, and the WDT time up signal is connected to $\overline{\text{RESET}}$.

Port 21 3 2 1 0 Initial value :0000

CWC	*	*	WDT
-----	---	---	-----

CWC	Clear watchdog timer counter
0	Clear counter then return to 1
1	Nothing

WDT	Set watch-dog-timer detect time
0	$3 \times 2^{13}/\text{LXIN} = 3 \times 2^{13}/32\text{K Hz} = 0.75 \text{ sec}$
1	$7 \times 2^{13}/\text{LXIN} = 7 \times 2^{13}/32\text{K Hz} = 1.75 \text{ sec}$

PROGRAM EXAMPLE

To enable WDT with $7 \times 2^{13}/\text{LXIN}$ detection time.

```
LDIA #0001B
OUTA P21; set WDT detection time and clear WDT counter
:
:
```

LCD DRIVER

EM73880 can directly drive the liquid crystal display (LCD) and has 32 segment, 4 common output pins (1/2 bias, 1/3 bias). There are total 32x4 dots can be display. The V1, V2, V3, VA, VB, VDD and VSS pins are the LCD bias generator.

CONTROL OF LCD DRIVER

The LCD driver control command register is P27. When LDC is 0, the LCD is disabled, and user could change Duty in this situation only the COM and SEG pins are VSS. When LDC is 1, the LCD driver enables. When the CPU is reseted or during the STOP operation mode, the LCD driver is disabled.

Port27 3 2 1 0 Initial value : 0000

LDC	DUTY
-----	------

LDC	LCD display control
0	LCD display disable and change Duty
1	LCD display enable

DUTY	Driving method select
0 0 0	1/4 duty (1/3 bias)
0 0 1	1/4 duty (1/2 bias)
0 1 0	1/3 duty (1/3 bias)
0 1 1	1/3 duty (1/2 bias)
1 0 0	1/2 duty (1/2 bias)
1 0 1	Static
1 1 *	Reserved

Preliminary

The LCD display data is stored in the display data area of the data memory (RAM).
The display data area begins with address 20H during reset. The LCD display data area is as below :

	RAM address	COM3 bit3	COM2 bit2	COM1 bit1	COM0 bit0
SEG0	20H				
SEG1	21H				
SEG2	22H				
:	:				
:	:				
SEG30	3EH				
SEG31	3FH				

The relation between LCD display data and driving method

Driving method	bit3	bit2	bit1	bit0
1/4 duty	COM3	COM2	COM1	COM0
1/3 duty	-	COM2	COM1	COM0
1/2 duty	-	-	COM1	COM0
Static	-	-	-	COM0

LCD frame frequency : According to the drive method to set the frame frequency.

Duty	Frame frequency (Hz)
1/4 duty	$64 \times (4/4) = 64$
1/3 duty	$64 \times (4/3) = 85$
1/2 duty	$64 \times (4/2) = 128$
Static	64

PROGRAM EXAMPLE :

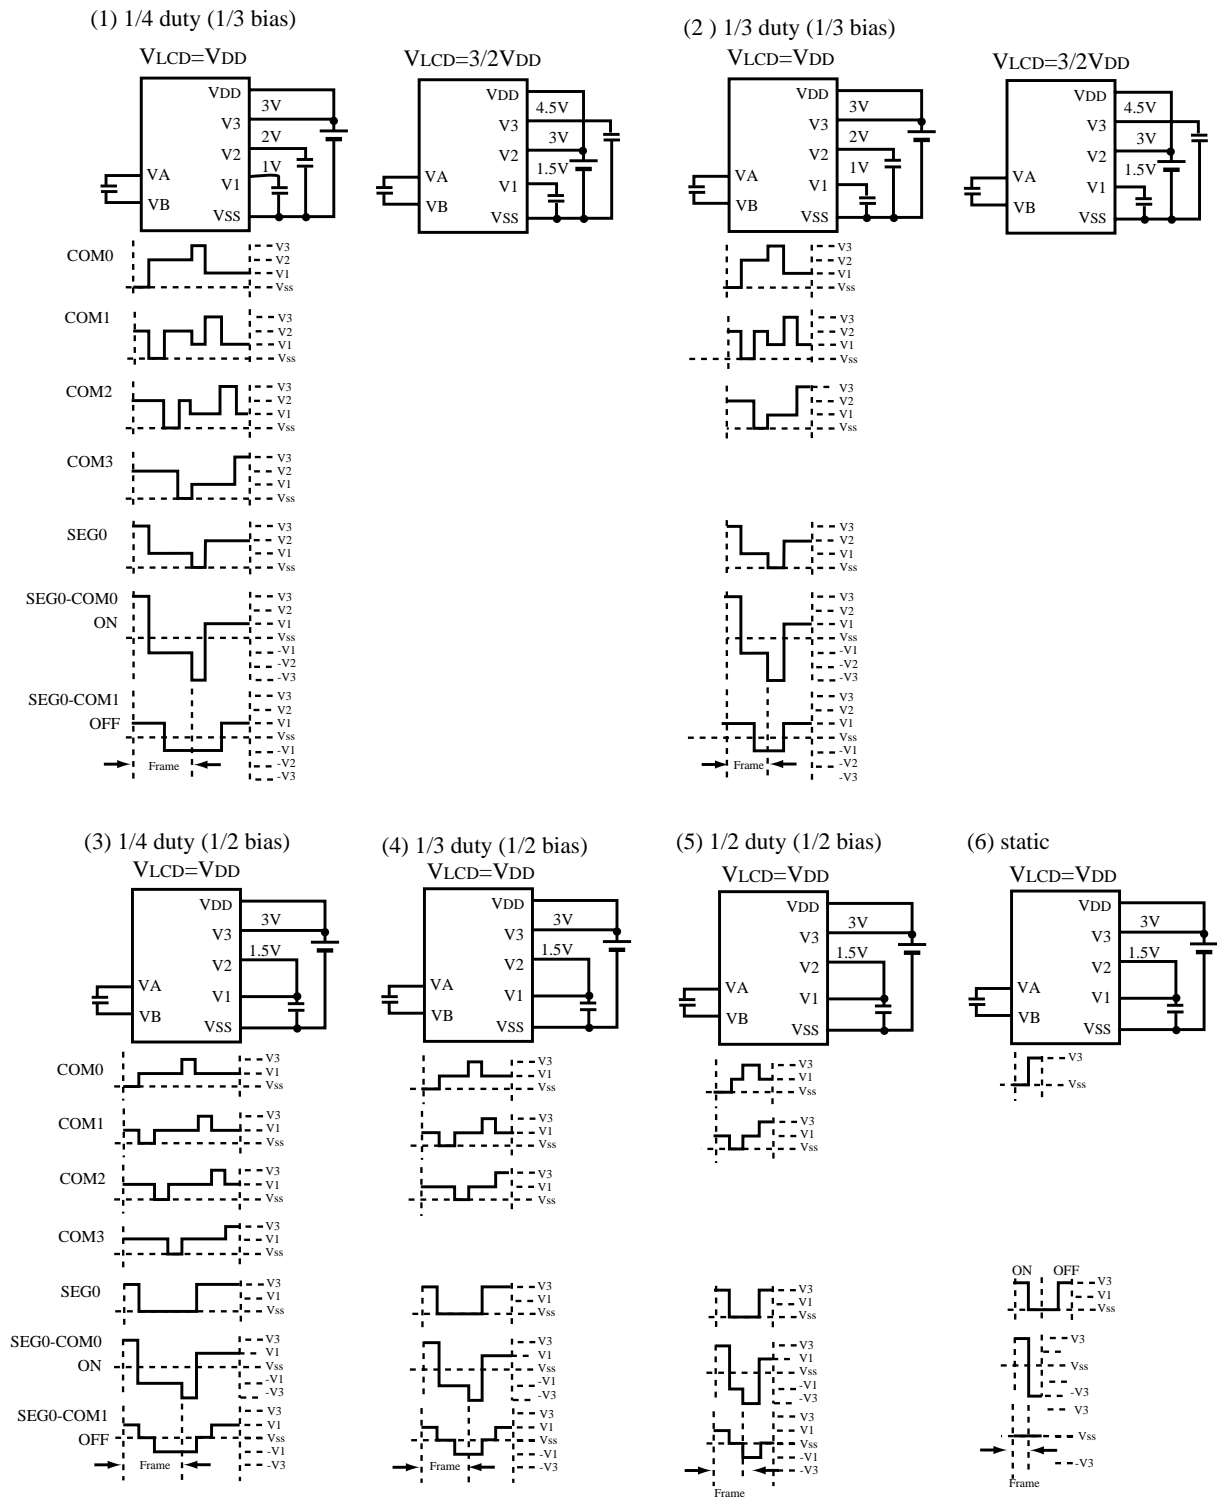

```
LDIA    #0001B    ; 1/4 duty, 1/2 bias
OUTA    P27
LDIA    #1001B    ; enable LCD
OUTA    P27
```

Preliminary

LCD DRIVING METHODS

There are six kinds of driving methods can be selected by DUTY (P27.0~P27.2). The drivinf waveforms of LCD driver are as below :

• VDD=3V

Preliminary

RESETTING FUNCTION

When CPU in normal working condition and $\overline{\text{RESET}}$ pin holds in low level for three instruction cycles at least, then CPU begins to initialize the whole internal states, and when $\overline{\text{RESET}}$ pin changes to high level, CPU begins to work in normal condition.

The CPU internal state during reset condition is as following table :

Hardware condition in RESET state	Initial value
Program counter	0000h
Status flag	01h
Interrupt enable flip-flop (EI)	00h
MASK0 ,1, 2, 3	00h
Interrupt latch (IL)	00h
P4, P5, P10, 11,14, 16, 19, 25, 27, 28, 29, 31	00h
P4, 8, 17, 23, 24	0Fh
Both oscillator	Start oscillation

The $\overline{\text{RESET}}$ pin is a hysteresis input pin and it has a pull-up resistor available by mask option. The simplest RESET circuit is connect $\overline{\text{RESET}}$ pin with a capacitor to V_{SS} and a diode to V_{DD} .

Preliminary

****** SYMBOL DESCRIPTION**

Symbol	Description	Symbol	Description
HR	H register	LR	L register
PC	Program counter	DP	Data pointer
SP	Stack pointer	STACK[SP]	Stack specified by SP
A _{CC}	Accumulator	FLAG	All flags
CF	Carry flag	ZF	Zero flag
SF	Status flag		
EI	Enable interrupt register	IL	Interrupt latch
MASK	Interrupt mask	PORT[p]	Port (address : p)
TA	Timer/counter A	TB	Timer/counter B
RAM[HL]	Data memory (address : HL)	RAM[x]	Data memory (address : x)
ROM[DP] _L	Low 4-bit of program memory	ROM[DP] _H	High 4-bit of program memory
[DP] _L	Low 4-bit of data pointer register	[DP] _M	Middle 4-bit of data pointer register
[DP] _H	High 4-bit of data pointer register	[TA] _L ([TB] _L)	Low 4-bit of timer/counter A (timer/counter B) register
[TA] _M ([TB] _M)	Middle 4-bit of timer/counter A (timer/counter B) register	[TA] _H ([TB] _H)	High 4-bit of timer/counter A (timer/counter B) register
←	Transfer	↔	Exchange
+	Addition	-	Substraction
&	Logic AND		Logic OR
^	Logic XOR	'	Inverse operation
.	Concatenation	#k	4-bit immediate data
x	8-bit RAM address	y	4-bit zero-page address
p	4-bit or 5-bit port address	b	Bit address
r	6-bit interrupt latch	PC ₁₁₋₆	Bit 11 to 6 of program counter
LR ₁₋₀	Contents of bit assigned by bit 1 to 0 of LR	a ₅₋₀	Bit 5 to 0 of destination address for branch instruction
LR ₃₋₂	Bit 3 to 2 of LR
