Triple 2-channel analogue multiplexer/demultiplexer

## DESCRIPTION

The HEF4053B is a triple 2-channel analogue multiplexer/demultiplexer with a common enable input ( $\overline{\mathrm{E}}$ ). Each multiplexer/demultiplexer has two independent inputs/outputs ( $Y_{0}$ and $Y_{1}$ ), a common input/output ( $Z$ ), and select inputs ( $\mathrm{S}_{\mathrm{n}}$ ). Each also contains two-bidirectional analogue switches, each with one side connected to an independent input/output ( $\mathrm{Y}_{0}$ and $\mathrm{Y}_{1}$ ) and the other side connected to a common input/output (Z).

With $\overline{\mathrm{E}}$ LOW, one of the two switches is selected (low impedance ON-state) by $S_{n}$. With $\overline{\mathrm{E}}$ HIGH, all switches are in the high impedance OFF-state, independent of $S_{A}$ to $S_{C}$.
$V_{D D}$ and $V_{S S}$ are the supply voltage connections for the digital control inputs ( $\mathrm{S}_{\mathrm{A}}$ to $\mathrm{S}_{\mathrm{C}}$ and $\overline{\mathrm{E}}$ ).
The $V_{D D}$ to $V_{S S}$ range is 3 to 15 V . The analogue inputs/outputs ( $\mathrm{Y}_{0}, \mathrm{Y}_{1}$ and Z ) can swing between $\mathrm{V}_{\mathrm{DD}}$ as a positive limit and $\mathrm{V}_{\mathrm{EE}}$ as a negative limit. $\mathrm{V}_{\mathrm{DD}}-\mathrm{V}_{\mathrm{EE}}$ may not exceed 15 V .

For operation as a digital multiplexer/demultiplexer, $\mathrm{V}_{\mathrm{EE}}$ is connected to $\mathrm{V}_{\text {SS }}$ (typically ground).

## Notes

1. $\mathrm{H}=\mathrm{HIGH}$ state (the more positive voltage)

L = LOW state (the less positive voltage)
$\mathrm{X}=$ state is immaterial

## RATINGS

Limiting values in accordance with the Absolute Maximum System (IEC 134)
Supply voltage (with reference to $\mathrm{V}_{\mathrm{DD}}$ ) $\quad \mathrm{V}_{\mathrm{EE}} \quad-18$ to $+0,5 \mathrm{~V}$

## Note

1. To avoid drawing $V_{D D}$ current out of terminal $Z$, when switch current flows into terminals $Y$, the voltage drop across the bidirectional switch must not exceed $0,4 \mathrm{~V}$. If the switch current flows into terminal Z , no $\mathrm{V}_{\mathrm{DD}}$ current will flow out of terminals Y , in this case there is no limit for the voltage drop across the switch, but the voltages at Y and Z may not exceed $\mathrm{V}_{\mathrm{DD}}$ or $\mathrm{V}_{\mathrm{EE}}$.

## Notes

$V_{\text {is }}$ is the input voltage at a $Y$ or $Z$ terminal, whichever is assigned as input.
$V_{\text {os }}$ is the output voltage at a $Y$ or $Z$ terminal, whichever is assigned as output.

## APPLICATION INFORMATION

Some examples of applications for the HEF4053B are:

- Analogue multiplexing and demultiplexing.
- Digital multiplexing and demultiplexing.
- Signal gating.

## NOTE

If break before make is needed, then it is necessary to use the enable input.
