## DESCRIPTION

The HEF4067B is a 16 -channel analogue multiplexer/demultiplexer with four address inputs ( $\mathrm{A}_{0}$ to $A_{3}$ ), an active LOW enable input ( $\bar{E}$ ), sixteen independent inputs/outputs $\left(Y_{0}\right.$ to $Y_{15}$ ) and a common input/output ( $Z$ ).

Fig. 1 Functional diagram.

The device contains sixteen bidirectional analogue switches, each with one side connected to an independent input/output ( $\mathrm{Y}_{0}$ to $\mathrm{Y}_{15}$ ) and the other side connected to the common input/output (Z).
With $\bar{E}$ LOW, one of the sixteen switches is selected (low impedance ON -state) by $\mathrm{A}_{0}$ to $\mathrm{A}_{3}$. All unselected switches are in the high impedance OFF-state. With $\overline{\mathrm{E}}$ HIGH all switches are in the high impedance OFF-state, independent of $A_{0}$ to $A_{3}$.

The analogue inputs/outputs ( $\mathrm{Y}_{0}$ to $\mathrm{Y}_{15}$ and Z ) can swing between $V_{D D}$ as a positive limit and $V_{S S}$ as a negative limit. $\mathrm{V}_{\mathrm{DD}}$ to $\mathrm{V}_{\mathrm{SS}}$ may not exceed 15 V .

## 16-channel analogue

Fig. 6 Typical Ron as a function of input voltage.

## NOTE

To avoid drawing $V_{D D}$ current out of terminal $Z$, when switch current flows into terminals $Y$, the voltage drop across the bidirectional switch must not exceed $0,4 \mathrm{~V}$. If the switch current flows into terminal $Z$, no $V_{D D}$ current will flow out of terminals Y , in this case there is no limit for the voltage drop across the switch, but the voltages at Y and Z may not exceed $V_{D D}$ or $V_{S S}$.

## APPLICATION INFORMATION

Some examples of applications for the HEF4067B are:

- Analogue multiplexing and demultiplexing.
- Digital multiplexing and demultiplexing.
- Signal gating.

## NOTE

If break before make is needed, then it is necessary to use the enable input.
