## 8-Bit Bidirectional Universal Shift Register with Parallel I/O High-Speed Silicon-Gate CMOS

The IN74AC299 is identical in pinout to the LS/ALS299, HC/HCT299. The device inputs are compatible with standard CMOS outputs; with pullup resistors, they are compatible with LS/ALS outputs.

The IN74AC299 features a multiplexed parallel input/output data port to achieve full 8 -bit handling in a 20 pin package. Due to the large output drive capability and the 3 -state feature, this device is ideally suited for interface with bus lines in a bus-oriented system.

Two Mode-Select inputs and two Output Enable inputs are used to choose the mode of operation as listed in the Function Table. Synchronous parallel loading is accomplished by taking both ModeSelect lines, $S_{1}$ and $S_{2}$, high. This places the outputs in the highimpedance state, which permits data applied to the data port to be clocked into the register. Reading out of the register can be accomplished when the outputs are enabled. The active-low asynchronous Reset overrides all other inputs.

- Outputs Directly Interface to CMOS, NMOS, and TTL
- Operating Voltage Range: 2.0 to 6.0 V
- Low Input Current: $1.0 \mu \mathrm{~A} ; 0.1 \mu \mathrm{~A} @ 25^{\circ} \mathrm{C}$
- High Noise Immunity Characteristic of CMOS Devices
- Outputs Source/Sink 24 mA

${ }^{*} \mathrm{~V}_{\text {IN }}$ from $30 \%$ to $70 \% \mathrm{~V}_{\mathrm{CC}}$

This device contains protection circuitry to guard against damage due to high static voltages or electric fields. However, precautions must be taken to avoid applications of any voltage higher than maximum rated voltages to this high-impedance circuit. For proper operation, $\mathrm{V}_{\text {IN }}$ and $\mathrm{V}_{\text {OUT }}$ should be constrained to the range $\mathrm{GND} \leq\left(\mathrm{V}_{\text {IN }}\right.$ or $\left.\mathrm{V}_{\mathrm{OUT}}\right) \leq \mathrm{V}_{\mathrm{CC}}$.

Unused inputs must always be tied to an appropriate logic voltage level (e.g., either GND or $\mathrm{V}_{\mathrm{CC}}$ ). Unused outputs must be left open.

$\mathrm{Z}=$ high impedance
$\mathrm{D}=$ data on serial input
F = flip-flop (see Logic Diagram)
$\uparrow$ When one or both output controls are high the eight input/output terminals are disabled to the highimpedance state; however, sequential operation or clearing of the register is not affected.

## EXPANDED LOGIC DIAGRAM

[^0]:    PIN $20=\mathrm{V}_{\mathrm{CC}}$
    PIN $10=$ GND

[^1]:    *Voltage Range 3.3 V is $3.3 \mathrm{~V} \pm 0.3 \mathrm{~V}$
    Voltage Range 5.0 V is $5.0 \mathrm{~V} \pm 0.5 \mathrm{~V}$
