

LC75874E, 75874W

1/4-Duty General-Purpose LCD Display Driver

Overview

The LC75874E and LC75874W are 1/4-duty general-purpose microprocessor-controlled LCD driver that can be used in applications such as frequency display in products with electronic tuning. In addition to being able to drive up to 264 segments directly, the LC75874E and LC75874W can also control up to 8 general-purpose output ports.

Since the LC75874E and LC75874W use separate power supply systems for the LCD drive block and the logic block, the LCD driver block power-supply voltage can be set to any voltage in the range 2.7 to 6.0 V, regardless of the logic block power-supply voltage.

Features

- Support for 1/4-duty 1/2-bias or 1/4-duty 1/3-bias drive techniques under serial data control (up to 264 segments)
- Serial data input supports CCB format communication with the system controller.
- Serial data control of the power-saving mode based backup function and the all segments forced off function.
- Serial data control of switching between the segment output port and general-purpose output port functions.
- High generality, since display data is displayed directly without the intervention of a decoder circuit.
- Independent V_{LCD} for the LCD driver block (V_{LCD} can be set to any voltage in the range 2.7 to 6.0 V, regardless of the logic block power-supply voltage.)
- The \overline{INH} pin allows the display to be forced to the off state.
- RC oscillator circuit

Package Dimensions

unit: mm

3174-QFP80E

unit: mm

3220-SQFP80

- CCB is a trademark of SANYO ELECTRIC CO., LTD.
- CCB is SANYO's original bus format and all the bus addresses are controlled by SANYO.

Top view

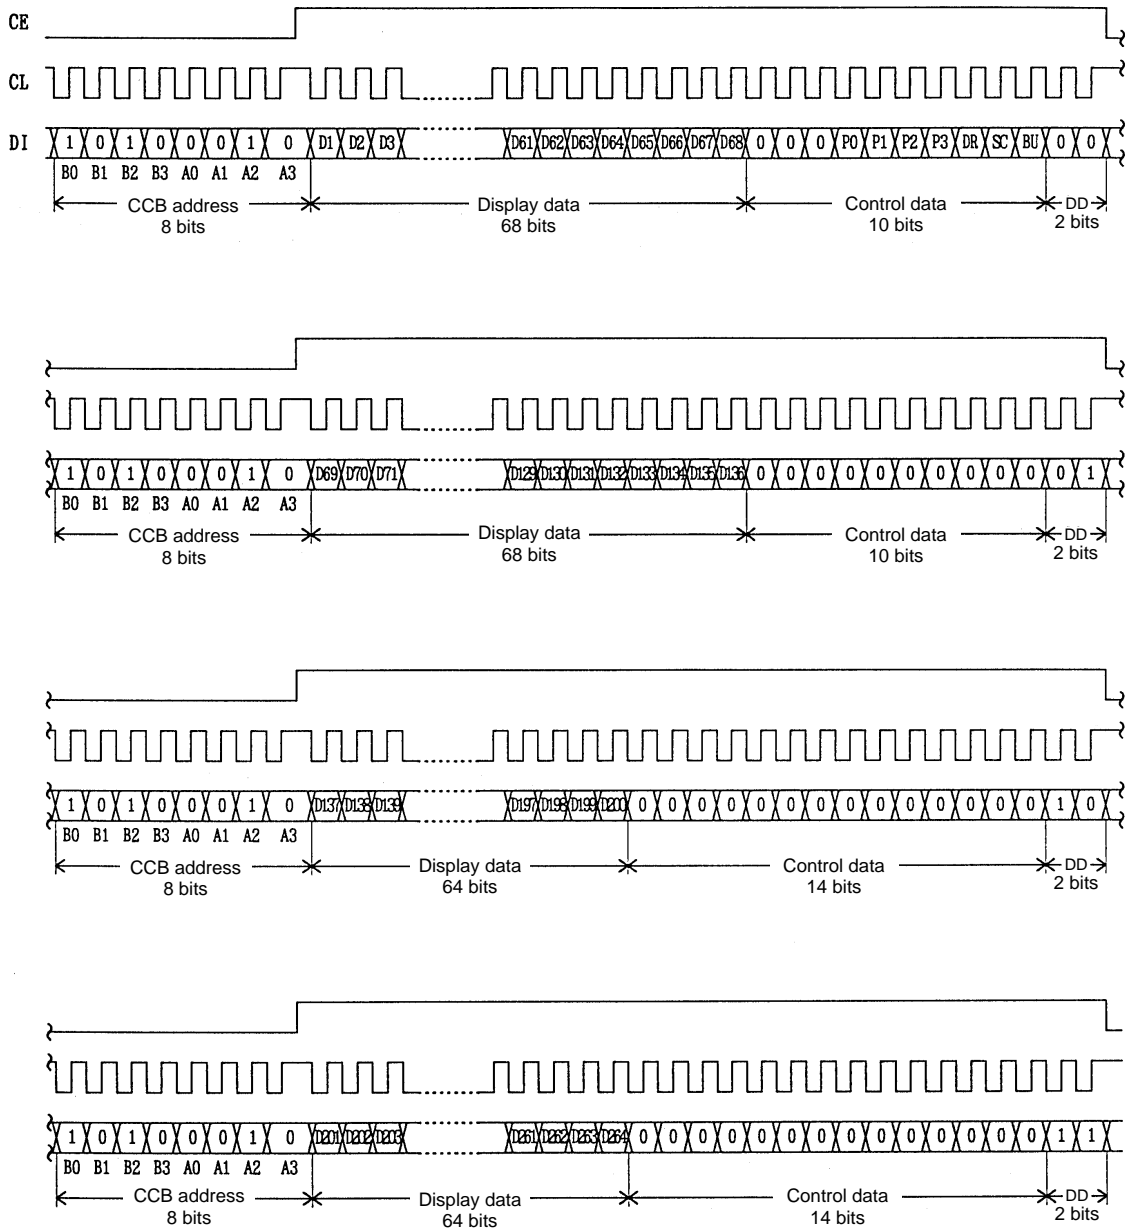

Serial Data Transfer Format

1. When CL is stopped at the low level

Note: DD is the direction data.

2. When CL is stopped at the high level

Note: DD is the direction data.

- CCB address.....45H
- D1 to D264.....Display data
- P0 to P3Segment output port/general-purpose output port switching control data
- DR1/2-bias drive or 1/3-bias drive switching control data
- SC.....Segments on/off control data
- BUNormal mode/power-saving mode control data

Serial Data Transfer Example

- When 201 or more segments are used
All 320 bits of serial data must be sent.

- When fewer than 201 segments are used
Either 80, 160 or 240 bits of serial data may be sent, depending on the number of segments used. However, the serial data shown below (the D1 to D68 display data and the control data) must be sent.

Control Data Functions

- P0 to P3: Segment output port/general-purpose output port switching control data
These control data bits switch the segment output port/general-purpose output port functions of the S1/P1 to S8/P8 output pins.

Control data				Output pin state							
P0	P1	P2	P3	S1/P1	S2/P2	S3/P3	S4/P4	S5/P5	S6/P6	S7/P7	S8/P8
0	0	0	0	S1	S2	S3	S4	S5	S6	S7	S8
0	0	0	1	P1	S2	S3	S4	S5	S6	S7	S8
0	0	1	0	P1	P2	S3	S4	S5	S6	S7	S8
0	0	1	1	P1	P2	P3	S4	S5	S6	S7	S8
0	1	0	0	P1	P2	P3	P4	S5	S6	S7	S8
0	1	0	1	P1	P2	P3	P4	P5	S6	S7	S8
0	1	1	0	P1	P2	P3	P4	P5	P6	S7	S8
0	1	1	1	P1	P2	P3	P4	P5	P6	P7	S8
1	0	0	0	P1	P2	P3	P4	P5	P6	P7	P8

Note: Sn (n = 1 to 8): Segment output port function
Pn (n = 1 to 8): General-purpose output port function

Note that when the general-purpose output port function is selected, the correspondence between the output pins and the display data will be that shown in the table.

Output pin	Corresponding display data
S1/P1	D1
S2/P2	D5
S3/P3	D9
S4/P4	D13

Output pin	Corresponding display data
S5/P5	D17
S6/P6	D21
S7/P7	D25
S8/P8	D29

For example, if the general-purpose output port function is selected for the S4/P4 output pin, that output pin will output a high level (V_{LCD}) when the display data D13 is 1, and a low level (V_{SS}) when the D13 is 0.

2. DR: 1/2-bias drive or 1/3-bias drive switching control data

This control data bit selects either 1/2-bias drive or 1/3-bias drive.

DR	Drive scheme
0	1/3-bias drive
1	1/2-bias drive

3. SC: Segment on/off control data

This control data controls the on/off state of the segments.

SC	Display state
0	On
1	Off

Note that when the segments are turned off by setting SC to 1, the segments are turned off by outputting segment off waveforms from the segment output pins.

4. BU: Normal mode/power-saving mode control data

This control data bit selects either normal mode or power-saving mode.

BU	Mode
0	Normal mode
1	Power saving mode. In this mode, the OSC pin oscillator is stopped and the common and segment output pins go to the V_{SS} level. However, the S1/P1 to S8/P8 output pins can be used as general-purpose output ports under the control of the data bits P0 to P3.

Note: This table assumes that the segment output port function is selected for the S1/P1 to S8/P8 output pins.

For example, the table below lists the output states for the S11 output pin.

Display data				Output pin (S11) state
D41	D42	D43	D44	
0	0	0	0	The LCD segments corresponding to COM1, COM2, COM3, and COM4 are off.
0	0	0	1	The LCD segments corresponding to COM4 are on.
0	0	1	0	The LCD segments corresponding to COM3 are on.
0	0	1	1	The LCD segments corresponding to COM3 and COM4 are on.
0	1	0	0	The LCD segments corresponding to COM2 are on.
0	1	0	1	The LCD segments corresponding to COM2 and COM4 are on.
0	1	1	0	The LCD segments corresponding to COM2 and COM3 are on.
0	1	1	1	The LCD segments corresponding to COM2, COM3, and COM4 are on.
1	0	0	0	The LCD segments corresponding to COM1 are on.
1	0	0	1	The LCD segments corresponding to COM1 and COM4 are on.
1	0	1	0	The LCD segments corresponding to COM1 and COM3 are on.
1	0	1	1	The LCD segments corresponding to COM1, COM3, and COM4 are on.
1	1	0	0	The LCD segments corresponding to COM1 and COM2 are on.
1	1	0	1	The LCD segments corresponding to COM1, COM2, and COM4 are on.
1	1	1	0	The LCD segments corresponding to COM1, COM2, and COM3 are on.
1	1	1	1	The LCD segments corresponding to COM1, COM2, COM3, and COM4 are on.

1/4-Duty 1/3-Bias Drive Scheme

1/4-Duty 1/3-Bias Waveforms

Display Control and the $\overline{\text{INH}}$ Pin

Since the LSI internal data (the display data D1 to D264 and the control data) is undefined when power is first applied, applications should prevent meaningless displays with the following procedure. First, set the $\overline{\text{INH}}$ pin low at the same time as power is applied to turn off the display. This will set the S1/P1 to S8/P8, S9 to S66, and COM1 to COM4 pins low. While the $\overline{\text{INH}}$ pin is held low, the control microprocessor should send the serial data. Finally, the application can set the $\overline{\text{INH}}$ pin to high. (See Figure 3.)

Notes on Power Supply Sequences

Applications must observe the following sequences when power is turned on or off.

- Power on: Turn on the logic power supply (V_{DD}) first → then turn on the LCD driver power supply (V_{LCD}).
- Power off: Turn off the LCD driver power supply (V_{LCD}) first → then turn off the logic power supply (V_{DD}).

However, if the logic and LCD driver block use a shared power supply, then the power supplies can be turned on and off at the same time.

Figure 3

Notes on Controller Transfer of Display Data

Since the LC75874E and LC75874W accept the display data (D1 to D264) divided into four separate transfer operations, we recommend that applications make a point of completing all four data transfers within a period of less than 30 ms to prevent observable degradation of display quality.

Sample Application Circuit 1

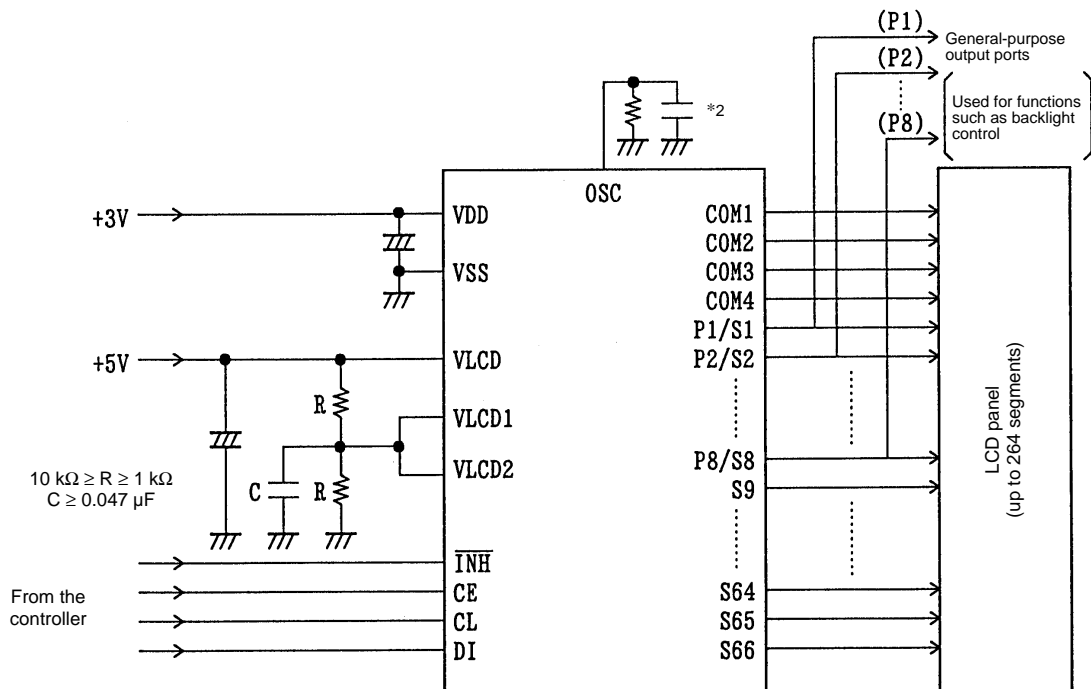

1/2 Bias (for normal LCD panels)

Note: *2 When a capacitor except the recommended external capacitance ($C_{osc} = 680 \text{ pF}$) is connected the OSC pin, we recommend that applications connect the OSC pin with a capacitor in the range 220 to 2200 pF.

Sample Application Circuit 2

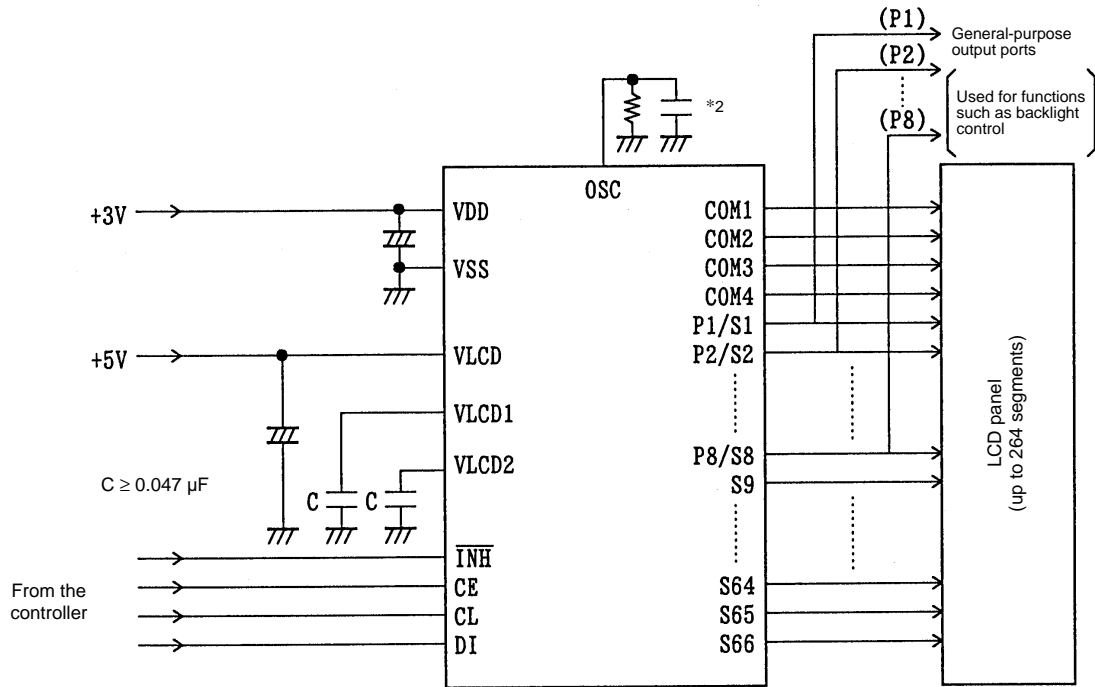

1/2 Bias (for large LCD panels)

Note: *2 When a capacitor except the recommended external capacitance ($C_{osc} = 680 \text{ pF}$) is connected the OSC pin, we recommend that applications connect the OSC pin with a capacitor in the range 220 to 2200 pF.

Sample Application Circuit 3

1/3 Bias (for normal LCD panels)

Note: *2 When a capacitor except the recommended external capacitance ($C_{osc} = 680 \text{ pF}$) is connected the OSC pin, we recommend that applications connect the OSC pin with a capacitor in the range 220 to 2200 pF.

Sample Application Circuit 4

1/3 Bias (for large LCD panels)

Note: *2 When a capacitor except the recommended external capacitance ($C_{osc} = 680 \text{ pF}$) is connected the OSC pin, we recommend that applications connect the OSC pin with a capacitor in the range 220 to 2200 pF.
