DESCRIPTION

The M54HC573 is an high speed CMOS OCTAL LATCH WITH 3-STATE OUTPUTS fabricated with silicon gate C²MOS technology. This 8-BIT D-Type latches is controlled by a latch enable input (LE) and output enable input (\overline{OE}).

PACKAGE	FM	EM

FPC	M54HC573K	M54HC573K1

While the LE input is held at a high level, the Q outputs will follow the data input precisely. When LE is taken low, the Q outputs will be latched precisely at the logic level of D input data. While the \overline{OE} input is at low level, the eight outputs will be in a normal logic state (high or low logic level) and while is at high level the outputs will be in a high impedance state.

The 3-State output configuration and the wide choice of outline make bus organized system simple.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.

1) C_{PD} is defined as the value of the IC's internal equivalent capacitance which is calculated from the operating current consumption without load. (Refer to Test Circuit). Average operating current can be obtained by the following equation. I_{CC(opr)} = C_{PD} × V_{CC} × f_{IN} + I_{CC}/8 (per Flip Flop) and the C_{PD} when n pcs of Flip Flop operate, can be gained by the following equation: C_{PD(TOTAL)} = 33 + 18 × n (pF)
