DESCRIPTION

The M74HC356 is an high speed CMOS 8 CHANNEL MULTIPLEXER/REGISTER (3-STATE) fabricated with silicon gate C²MOS technology.

This device contains an 8 channel digital multiplexer with an 8-input data register and a 3-bit address input register with 3-state outputs. The one of eight input data will be provided on the Y output pin (non-inverted output) and W output pin (inverted output) determined by the address data. The information at the data inputs (D0 to D7) is stored in the 8-bit flip-flop at the positive going edge of clock input (CLOCK). The

information at the address inputs (S0 to S2) is stored in the 3-bit latch at the negative pulse on \overline{SC} input. These outputs are disabled to be high-impedance when input $\overline{G1}$ is held high, input $\overline{G2}$ is held high or input $\overline{G3}$ is held low. This device is suitable for interfacing with bus lines in a bus organized system.

The M74HC356 is similar in function to the M74HC354, which has an 8-bit latch as the data register instead of an 8-bit flip-flop.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.
