CMOS

## FR30 Family MB91150 Series

### MB91F155/MB91154

#### ■ DESCRIPTION

The MB91150 is a single-chip microcontroller using a RISC-CPU (FR 30 series) as its core. It contains peripheral I/O resources suitable for audio, MD and so on which are required to operate at low power consumption.

#### ■ FEATURES

##### 1. CPU

- 32-bit RISC (FR30) , load/store architecture, 5-stage pipeline
- General-purpose registers: 32 bits ×16
- 16-bit fixed-length instructions (basic instructions) , 1 instruction/ 1 cycle
- Memory-to-memory transfer, bit processing, barrel shift processing : Optimized for embedded applications
- Function entrance/exit instructions, and multiple load/store instructions of register contents, instruction systems supporting high level languages
- Register interlock functions, efficient assembly language description
- Branch instructions with delay slots : Reduced overhead time in branching executions
- Internal multiplier/supported at instruction level
  - Signed 32-bit multiplication : 5 cycles
  - Signed 16-bit multiplication : 3 cycles
- Interrupt (PC and PS saving) : 6 cycles, 16 priority levels

(Continued)

#### ■ PACKAGE

144-pin plastic LQFP

(FPT-144P-M08)

# MB91F155/MB91154

## 2. Bus Interface

- 16-bit address output, 8/16-bit data input and output
- Basic bus cycle : 2-clock cycle
- Support for interface for various types of memory
- Unused data/address pins can be configured as input/output ports
- Support for little endian mode

## 3. Internal ROM

MB91F155

FLASH products : 510 Kbytes

MB91154

Mask product : 384 Kbytes

## 4. Internal RAM

Mask, FLASH products : 2 Kbytes

## 5. Internal Backup RAM

MB91F155

FLASH products : 32 Kbytes

MB91154

Mask product : 20 Kbytes

More power can be saved by entering backup mode and then applying power supply current only to the backup RAM.

## 6. DMAC

DMAC in descriptor format for placing transfer parameters on to the main memory.  
Capable of transferring a maximum of eight internal and external factors combined.  
Three channels for external factors

## 7. Bit Search Module

Searches in one cycle for the position of the bit that changes from the MSB in one word to the initial I/O.

## 8. Timers

- 16-bit OCU × 8 channels, ICU × 4 channels, Free-run timer × 1 channel
- 8/16-bit up/down timer/counter (8-bit × 2 channels or 16-bit × 1 channel)  
AIN and BIN share pins with internal interrupts.
- 16-bit PPG timer × 6 channels. The output pulse cycle and duty can be varied as desired
- 16-bit reload timer × 4 channels

## 9. D/A Converter

- 8-bit × 3 channels

## 10. A/D Converter (Sequential Comparison Type)

- 10-bit × 8 channels
- Sequential conversion method (conversion time : 5.0 μs@33 MHz)
- Single conversion or scan conversion can be selected, and one-shot or continuous or stop conversion mode can be set respectively.
- Conversion starting function by hardware/software.

(Continued)

(Continued)

## 11. Serial I/O

- UART × 4 channels. Any of them is capable of serial transfer in sync with clock attached with the LSB/MSB switching function.
- Serial data output and serial clock output are selectable by push-pull/open drain software.
- A 16-bit timer (U-timer) is contained as a dedicated baud rate generator allowing any baud rate to be generated.

## 12. I<sup>2</sup>C Bus Interface

- One channel master/slave send and receive
- Arbitration and clock synchronization functions  
(The product is licensed with the Philips I<sup>2</sup>C patent to support those customers who intend to use this product in an I<sup>2</sup>C system in compliance with the standard I<sup>2</sup>C specification stipulated by Philips.)

## 13. Clock Switching Function

- Gear function : Operating clock ratios to the basic clock can be set independently for the CPU and peripherals from four types, 1 : 1, 1 : 2, 1 : 4 or 1 : 8.

## 14. Clock Function (Calendar Macro)

- Internal 32 kHz clock function
- Capable of operating in clock mode to run only the clock function while the CPU and peripheral macros are stopped.

## 15. Interrupt Controller

External interrupt input (16 channels in total) :

- Allows the rising edge/falling edge/H level/L level to be set.

Internal interrupt factors :

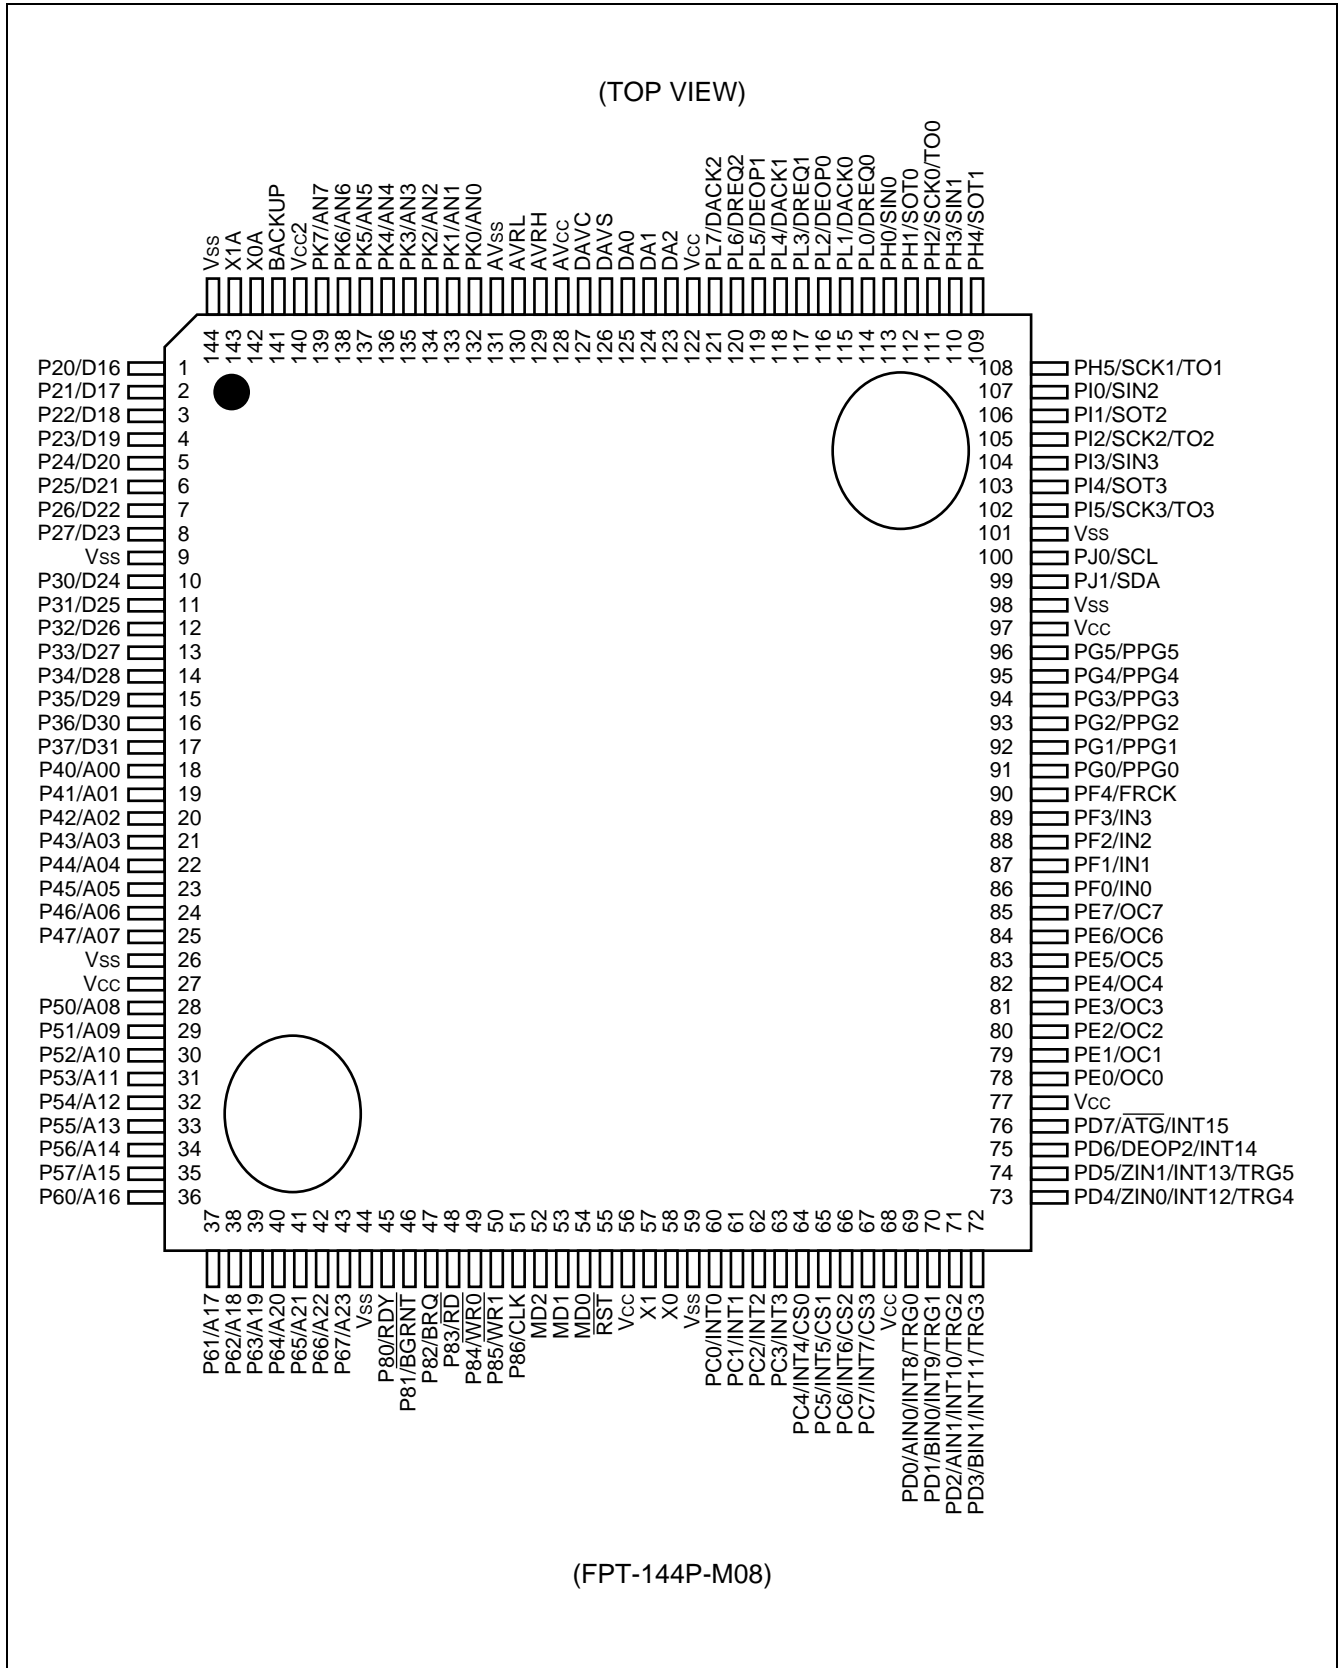

- Interrupt by resources and delay interrupt

## 16. Others

- Reset cause : Power on reset/watchdog timer/software reset/external reset
- Low power consumption mode : Sleep/stop/clock mode
- Package : LQFP 144-pin
- CMOS technology (0.35 μm)
- Power supply voltage : 3.15 V to 3.6 V

# MB91F155/MB91154

## PIN ASSIGNMENT

## ■ PIN DESCRIPTION

Pin No.	Pin name	Circuit type	Function
1 2 3 4 5 6 7 8	D16/P20 D17/P21 D18/P22 D19/P23 D20/P24 D21/P25 D22/P26 D23/P27	C	Bit 16 to bit 23 of external data bus These pins are enabled only in 16-bit external bus mode. These pins are available as ports in single-chip and 8-bit external bus modes.
10 11 12 13 14 15 16 17	D24/P30 D25/P31 D26/P32 D27/P33 D28/P34 D29/P35 D30/P36 D31/P37	C	Bit 24 to bit 31 of external data bus These pins are available as ports in single-chip mode.
18 19 20 21 22 23 24 25 28 29 30 31 32 33 34 35	A00/P40 A01/P41 A02/P42 A03/P43 A04/P44 A05/P45 A06/P46 A07/P47 A08/P50 A09/P51 A10/P52 A11/P53 A12/P54 A13/P55 A14/P56 A15/P57	F	Bit 0 to bit 15 of external address bus These pins are enabled in external bus mode. These pins are available as ports in single-chip mode.
36 37 38 39 40 41 42 43	A16/P60 A17/P61 A18/P62 A19/P63 A20/P64 A21/P65 A22/P66 A23/P67	O	Bit 16 to bit 23 of external address bus These pins are available as ports when the address bus is not in use.
45	RDY/P80	C	External RDY input This function is enabled when external RDY input is allowed. Input "0" when the bus cycle being executed does not end. This pin is available as a port when external RDY input is not in use.

*(Continued)*

# MB91F155/MB91154

Pin No.	Pin name	Circuit type	Function
46	$\overline{\text{BGRNT}}/\text{P81}$	F	External bus release acceptance output This function is enabled when external bus release acceptance output is allowed. Output "L" upon releasing of the external bus. This pin is available as a port when external bus release acceptance output is not allowed.
47	BRQ/P82	C	External bus release request input This function is enabled when external bus release request input is allowed. Input "1" when the release of the external bus is desired. This pin is available as a port when external bus release request input is not in use.
48	$\overline{\text{RD}}/\text{P83}$	F	External bus read strobe output This function is enabled when external bus read strobe output is allowed. This pin is available as a port when external bus read strobe output is not allowed.
49	$\overline{\text{WR0}}/\text{P84}$	F	External bus write strobe output This function is enabled in external bus mode. This pin is available as a port in single chip mode.
50	$\overline{\text{WR1}}/\text{P85}$	F	External bus write strobe output This function is enabled in external bus mode when the bus width is 16 bits. This pin is available as a port in single chip mode or when the external bus width is 8 bits.
51	CLK/P86	F	System clock output The pin outputs the same clock as the external bus operating frequency. The pin is available as a port when it is not used to output the clock.
52 53 54	MD2 MD1 MD0	G	Mode pins To use these pins, connect them directly to either Vcc or Vss. Use these pins to set the basic MCU operating mode.
55	$\overline{\text{RST}}$	B	External reset input
57 58	X1 X0	A	High-speed clock oscillation pins (16.5 MHz)
60 61 62 63	INT0/PC0 INT1/PC1 INT2/PC2 INT3/PC3	H	External interrupt request input 0-3 Since this input is used more or less continuously when the corresponding external interrupt is allowed, output by the port needs to be stopped except when it is performed deliberately. Since this port is allowed to input also in standby mode, it can be used to reset the standby state. These pins are available as ports when external interrupt request input is not in use.

Pin No.	Pin name	Circuit type	Function
78 79 80 81 82 83 84 85	PE0/OC0 PE1/OC1 PE2/OC2 PE3/OC3 PE4/OC4 PE5/OC5 PE6/OC6 PE7/OC7	F	Output compare output These pins are available as ports when output compare output is not allowed.
86 87 88 89	PF0/IN0 PF1/IN1 PF2/IN2 PF3/IN3	F	Input capture input This function is enabled when the input capture operation is input. These pins are available as ports when input capture input is not in use.
90	PF4/FRCK	F	Free-run timer external clock input pin This pin is available as a port when free-run timer external clock input is not in use.
91 92 93 94 95 96	PG0/PPG0 PG1/PPG1 PG2/PPG2 PG3/PPG3 PG4/PPG4 PG5/PPG5	F	PPG timer output This function is enabled when PPG timer output is allowed. These pins are available as ports when PPG timer output is not allowed.
99	PJ1/SDA	Q	I <sup>2</sup> C interface I/O pin This function is enabled when the I <sup>2</sup> C interface is allowed to operate. While the I <sup>2</sup> C interface is in operation, keep the port output set to Hi-Z. This pin is available as a port when the I <sup>2</sup> C interface is not in use.
100	PJ0/SCL	Q	I <sup>2</sup> C interface I/O pin This function is enabled when the I <sup>2</sup> C interface is allowed to operate. While the I <sup>2</sup> C interface is in operation, keep the port output set to Hi-Z. This pin is available as a port when the I <sup>2</sup> C interface is not in use.
102	PI5/SCK3/TO3	P	UART3 clock I/O, Reload timer 3 output When UART3 clock output is not allowed, reload timer 3 can be output by allowing it. This pin is available as a port when neither UART3 clock output nor reload timer output is allowed.
103	PI4/SOT3	P	UART3 data output This function is enabled when UART3 data output is allowed. This pin is available as a port when UART3 clock output is not allowed.
104	PI3/SIN3	P	UART3 data input Since this input is used more or less continuously while UART3 is engaged in input operations, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when UART3 output data input is not in use.

(Continued)

Pin No.	Pin name	Circuit type	Function
105	PI2/SCK2/TO2	P	UART2 clock I/O, Reload timer 2 output When UART2 clock output is not allowed, reload timer 2 can be output by allowing it. This pin is available as a port when neither UART2 clock output nor reload timer output is allowed.
106	PI1/SOT2	P	UART2 data output This function is enabled when UART2 data output is allowed. This pin is available as a port when UART2 clock output is not allowed.
107	PI0/SIN2	P	UART2 data input Since this input is used more or less continuously while UART2 is engaged in input operations, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when UART2 data input is not in use.
108	PH5/SCK1/TO1	P	UART1 clock I/O, Reload timer 1 output When UART1 clock output is not allowed, reload timer 1 can be output by allowing it. This pin is available as a port when neither UART1 clock output nor reload timer output is allowed.
109	PH4/SOT1	P	UART1 data output This function is enabled when UART1 data output is allowed. This pin is available as a port when UART1 clock output is not allowed.
110	PH3/SIN1	P	UART1 data input Since this input is used more or less continuously while UART1 is engaged in input operations, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when UART1 data input is not in use.
111	PH2/SCK0/TO0	P	UART0 clock I/O, Reload timer 0 output When UART0 clock output is not allowed, reload timer 0 can be output by allowing it. This pin is available as a port when neither UART0 clock output nor reload timer output is allowed.
112	PH1/SOT0	P	UART0 data output This function is enabled when UART0 data output is allowed. This pin is available as a port when UART0 clock output is not allowed.
113	PH0/SIN0	P	UART0 data input Since this input is used more or less continuously while UART0 is engaged in input operations, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when UART0 data input is not in use.
114	DREQ0/PL0	F	DMA external transfer request input Since this input is used more or less continuously when selected as a DMAC transfer factor, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when DMA external transfer request input is not in use.

*(Continued)*

# MB91F155/MB91154

Pin No.	Pin name	Circuit type	Function
115	DACK0/PL1	F	DMA external transfer request acceptance output This function is enabled when the DMAC external transfer request acceptance is allowed to be output. This pin is available as a port when the DMAC transfer request acceptance is not allowed to be output.
116	DEOP0/PL2	F	DMA external transfer end output This function is enabled when the end of DMAC external transfer is allowed to be output.
117	DREQ1/PL3	F	DMA external transfer request input Since this input is used more or less continuously when selected as a DMAC transfer factor, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when DMA external transfer request input is not in use.
118	DACK1/PL4	F	DMA external transfer request acceptance output This function is enabled when the DMAC external transfer request acceptance is allowed to be output. This pin is available as a port when DMAC transfer request acceptance output is not allowed.
119	DEOP1/PL5	F	DMA external transfer end output This function is enabled when the end of DMAC external transfer is allowed to be output.
120	DREQ2/PL6	F	DMA external transfer request input Since this input is used more or less continuously when selected as a DMAC transfer factor, output by the port needs to be stopped except when it is performed deliberately. This pin is available as a port when DMA external transfer request input is not in use.
121	DACK2/PL7	F	DMA external transfer request acceptance output This function is enabled when the DMAC external transfer request acceptance is allowed to be output. This pin is available as a port when DMAC transfer request acceptance output is not allowed.
123 124 125	DA2 DA1 DA0	—	D/A converter output This function is enabled when D/A converter output is allowed.
126	DAVS	—	Power supply pin for the D/A converter
127	DAVC	—	Power supply pin for the D/A converter
128	AV <sub>cc</sub>	—	V <sub>cc</sub> power supply for the A/D converter
129	AVRH	—	A/D converter reference voltage (high potential side) Be sure to turn on/off this pin with potential higher than AVRH applied to V <sub>cc</sub> .
130	AVRL	—	A/D converter reference voltage (low potential side)
131	AV <sub>ss</sub>	—	V <sub>ss</sub> power supply for the A/D converter

(Continued)

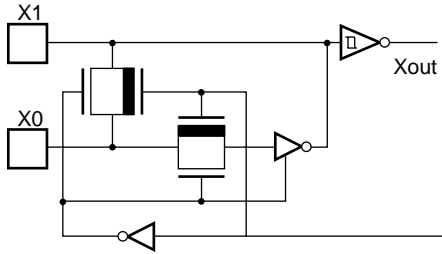

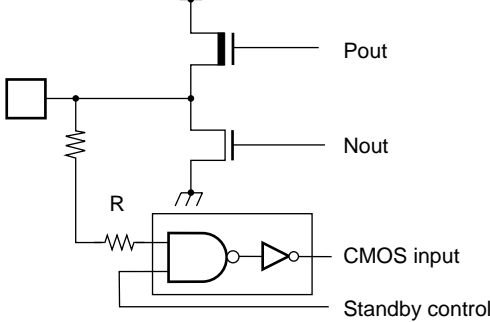

(Continued)

Pin No.	Pin name	Circuit type	Function
132 133 134 135 136 137 138 139	AN0/PK0 AN1/PK1 AN2/PK2 AN3/PK3 AN4/PK4 AN5/PK5 AN6/PK6 AN7/PK7	N	A/D converter analog input These pins are enabled when the AIC register is designated for analog input. These pins are available as ports when A/D converter analog input is not in use.
140	V <sub>cc2</sub>	—	Backup power supply pin
141	BACKUP	G	Backup circuit protection signal input
142 143	X0A X1A	K	Low-speed clock (32 kHz) oscillation pin
27, 56, 68, 77, 97, 122	V <sub>cc</sub>	—	Power supply pin (V <sub>cc</sub> ) for digital circuit Always power supply pin (V <sub>cc</sub> ) must be connected to the power supply
9, 26, 44, 59, 98, 101, 144	V <sub>ss</sub>	—	Earth level (V <sub>ss</sub> ) for digital circuit Always power supply pin (V <sub>ss</sub> ) must be connected to the power supply

Note : On the majority of pins listed above, the I/O port and the resource I/O are multiplexed, such as XXXX/Pxx.  
When the port and the resource output compete against each other on these pins, priority is given to the resource.

## ■ HANDLING DEVICES

### 1. Preventing Latchup

In CMOS ICs, applying voltage higher than  $V_{CC}$  or lower than  $V_{SS}$  to input/output pin or applying voltage over rating across  $V_{CC}$  and  $V_{SS}$  may cause latchup.

This phenomenon rapidly increases the power supply current, which may result in thermal breakdown of the device. Make sure to prevent the voltage from exceeding the maximum rating.

### 2. Treatment of Pins

- **Treatment of unused pins**

Unused pins left open may cause malfunctions. Make sure to connect them to pull-up or pull-down resistors.

- **Treatment of open pins**

Be sure to use open pins in open state.

- **Treatment of output pins**

Shortcircuiting an output pin with the power supply or with another output pin or connecting a large-capacity load may causes a flow of large current. If this conditions continues for a lengthy period of time, the device deteriorates. Take great care not to exceed the absolute maximum ratings.

- **Mode pins (MD0-MD2)**

These pins should be used directly connected to either  $V_{CC}$  or  $V_{SS}$ . In order to prevent noise from causing accidental entry into test mode, keep the pattern length as short as possible between each mode pin and  $V_{CC}$  or  $V_{SS}$  on the board and connect them with low impedance.

- **Power supply pins**

When there are several  $V_{CC}$  and  $V_{SS}$  pins, each of them is equipotentially connected to its counterpart inside of the device, minimizing the risk of malfunctions such as latch up. To further reduce the risk of malfunctions, to prevent EMI radiation, to prevent strobe signal malfunction resulting from creeping-up of ground level and to observe the total output current standard, connect all  $V_{CC}$  and  $V_{SS}$  pins to the power supply or GND.

It is preferred to connect  $V_{CC}$  and  $V_{SS}$  of MB91F15\*/MB9115\* to power supply with minimal impedance possible.

It is also recommended to connect a ceramic capacitor as a bypass capacitor of about 0.1  $\mu\text{F}$  between  $V_{CC}$  and  $V_{SS}$  at a position as close as possible to MB91F155/MB91154.

- **Crystal oscillator circuit**

Noises around X0, X1, X0A, and X1A pins may cause malfunctions of MB91F155/MB91154. In designing the PC board, layout X0, X1 (X0A, X1A) and crystal oscillator (or ceramic oscillator) and bypass capacitor for grounding as close as possible.

It is strongly recommended to design PC board so that X0, X1, X0A, and X1A pins are surrounded by grounding area for stable operation.

The MB91F155 and MB91154 devices do not contain a feedback resistor. To use the clock function, you need to connect an external resistor.

### 3. Precautions

- **External Reset Input**

It takes at least 5 machine cycle to input "L" level to the  $\overline{\text{RST}}$  pin and to ensure inner reset operation properly.

- **External Clocks**

When using an external clock, normally, a clock of which the phase is opposite to that of X0 must be supplied

# MB91F155/MB91154

to the X0 and X1 pins simultaneously. However, when using the clock along with STOP (oscillation stopped) mode, the X1 pin stops when “H” is input in STOP mode. To prevent one output from competing against another, an external resistor of about 1 kΩ should be provided.

The following figure shows an example usage of an external clock.

Figure 2.1 An example usage of an external clock

## 4. Care During Powering Up

### • When powering up

When turning on the power supply, never fail to start from setting the  $\overline{\text{RST}}$  pin to “L” level. And after the power supply voltage goes to  $V_{\text{CC}}$  level, at least after ensuring the time for 5 machine cycle, then set to “H” level.

### • Source oscillation input

At turning on the power supply, never fail to input the clock before cancellation of the oscillation stabilizing waiting.

### • Power on resetting

When powering up or when turning the power back on after the supply voltage drops below the operation assurance range, be sure to reset the power.

### • Power on sequence (When $V_{\text{CC}2}$ is connected to $V_{\text{CC}}$ )

Turn on the power in the order of  $V_{\text{CC}}$ ,  $AV_{\text{CC}}$  and  $AV_{\text{RH}}$ . The power should be disconnected in inverse order.

### • Even when an AD converter is not in use, connect $AV_{\text{CC}}$ to the $V_{\text{CC}}$ level and $AV_{\text{SS}}$ to the $V_{\text{SS}}$ level.

### • Even when a DA converter is not in use, connect $DA_{\text{VC}}$ to the $V_{\text{CC}}$ level and $DA_{\text{VS}}$ to the $V_{\text{SS}}$ level.

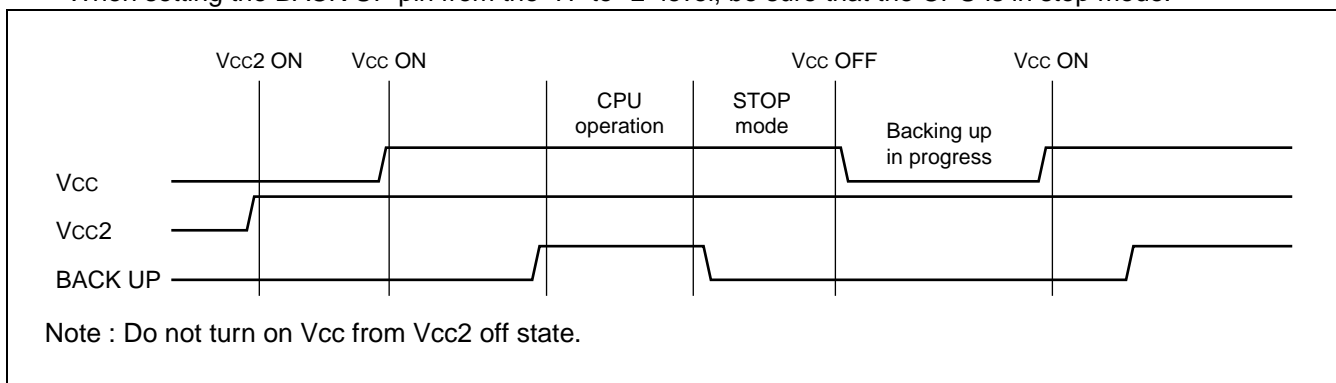

## 5. Powering Up and Backup Mode

This product type has a backup RAM and a  $V_{\text{CC}2}$  power supply dedicated to the calendar macro. With respect to the  $V_{\text{CC}2}$  and backup pin, adhere to the following :

### • When turning on only $V_{\text{CC}2}$ with $V_{\text{CC}}$ turned off, be sure that the BACK UP pin is on the “L” level.

### • Be sure that the BACK UP pin reaches the “H” level after $V_{\text{CC}}$ is turned on. When $V_{\text{CC}}$ is off, the BACK UP pin must be on the “L” level.

### • When setting the BACK UP pin from the “H” to “L” level, be sure that the CPU is in stop mode.

## 6. When the Clock Function (Calendar Macro) Is Not in Use

When using only the internal backup RAM (the clock function not in use) , the clock oscillation pin must be configured as shown next.

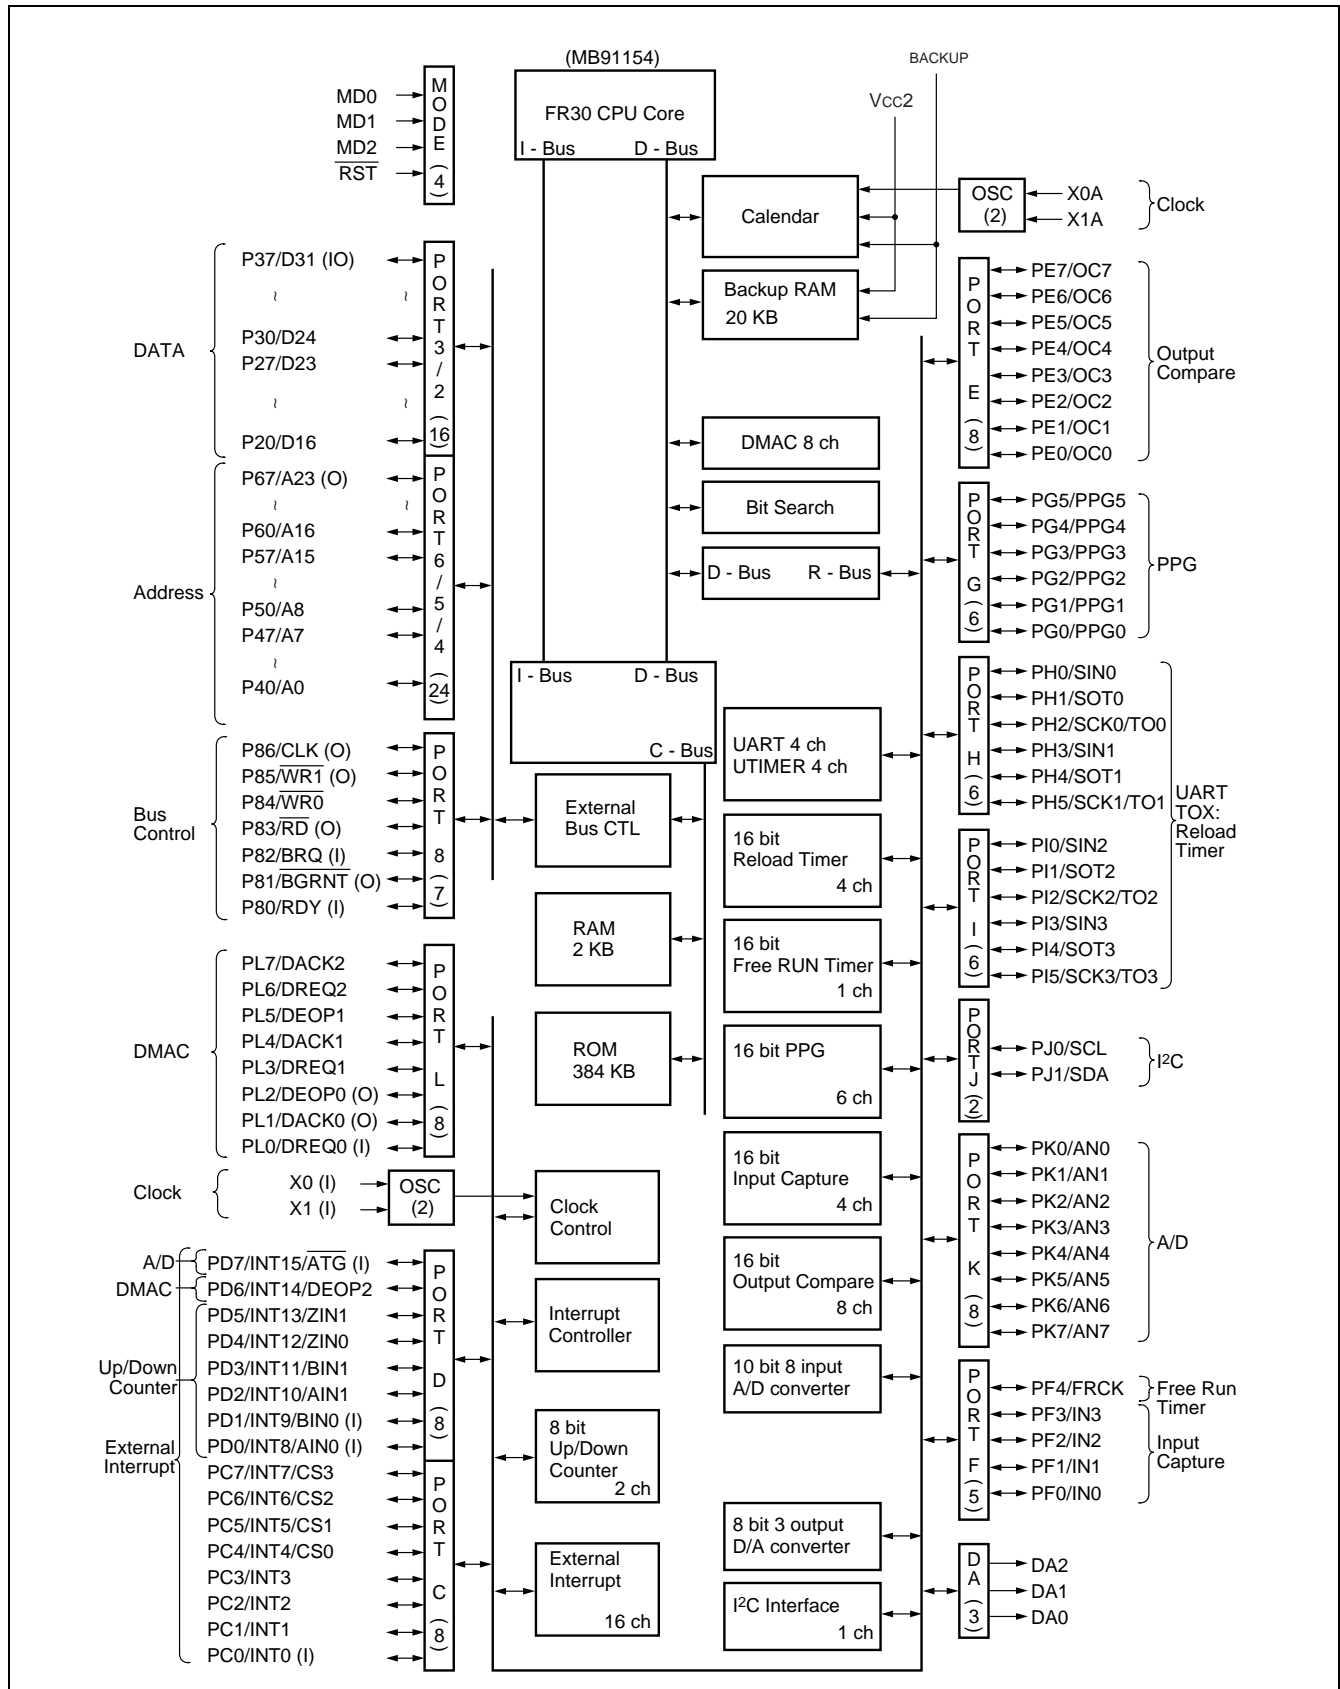

This product type does not allow the clock crystal oscillator to be stopped with software.

# MB91F155/MB91154

## ■ CPU CORE

### 1. Memory Space

The FR family has a logical address space of 4 Gbytes ( $2^{32}$  bytes) and the CPU linearly accesses the memory space.

- **Direct addressing area**

The following area in the address space is used for I/O.

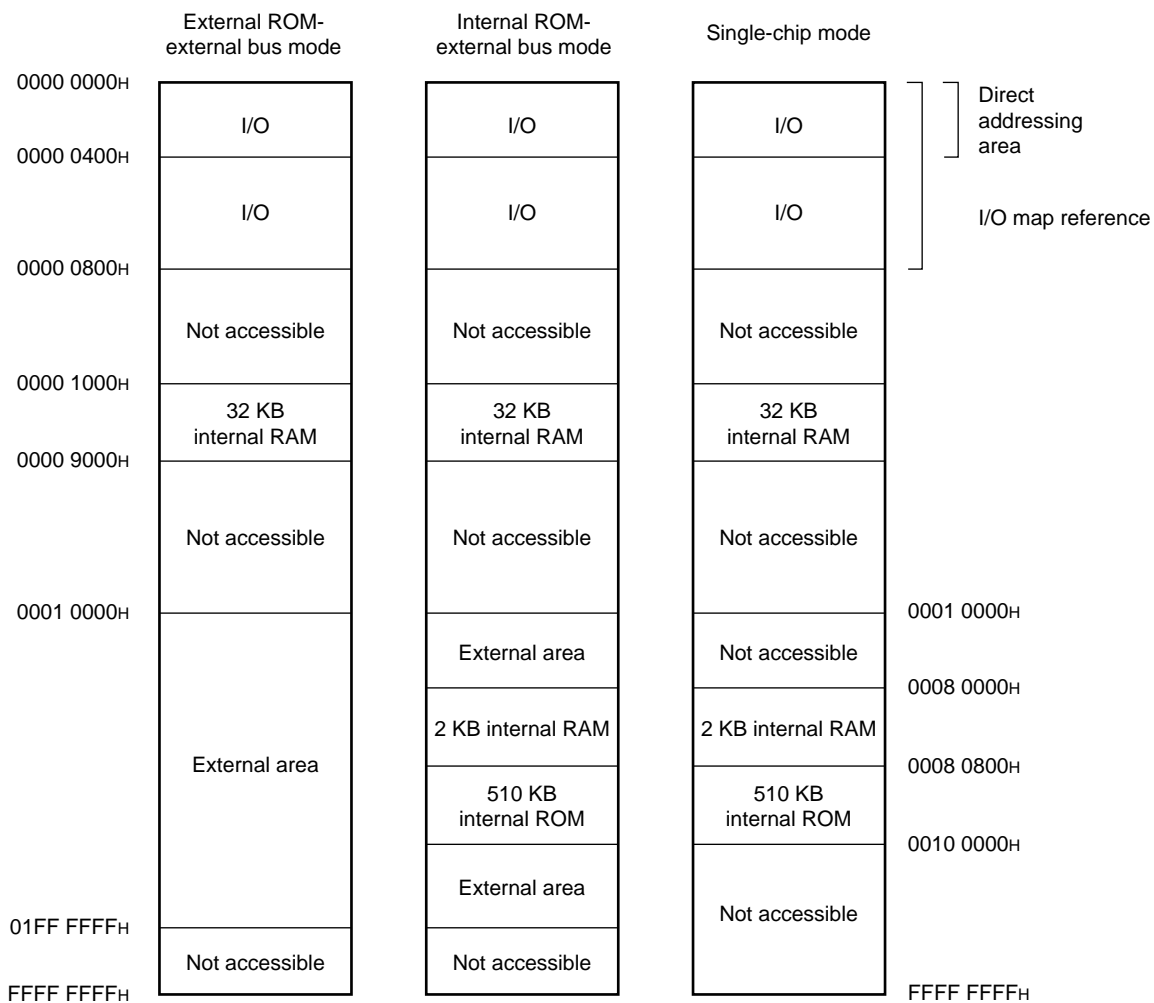

This area is called direct addressing area and an operand address can be specified directly in an instruction.

The direct addressing area varies with the data size to be accessed as follows :

- byte data access : 0-0FF<sub>H</sub>
- half word data access : 0-1FF<sub>H</sub>
- word data access : 0-3FF<sub>H</sub>

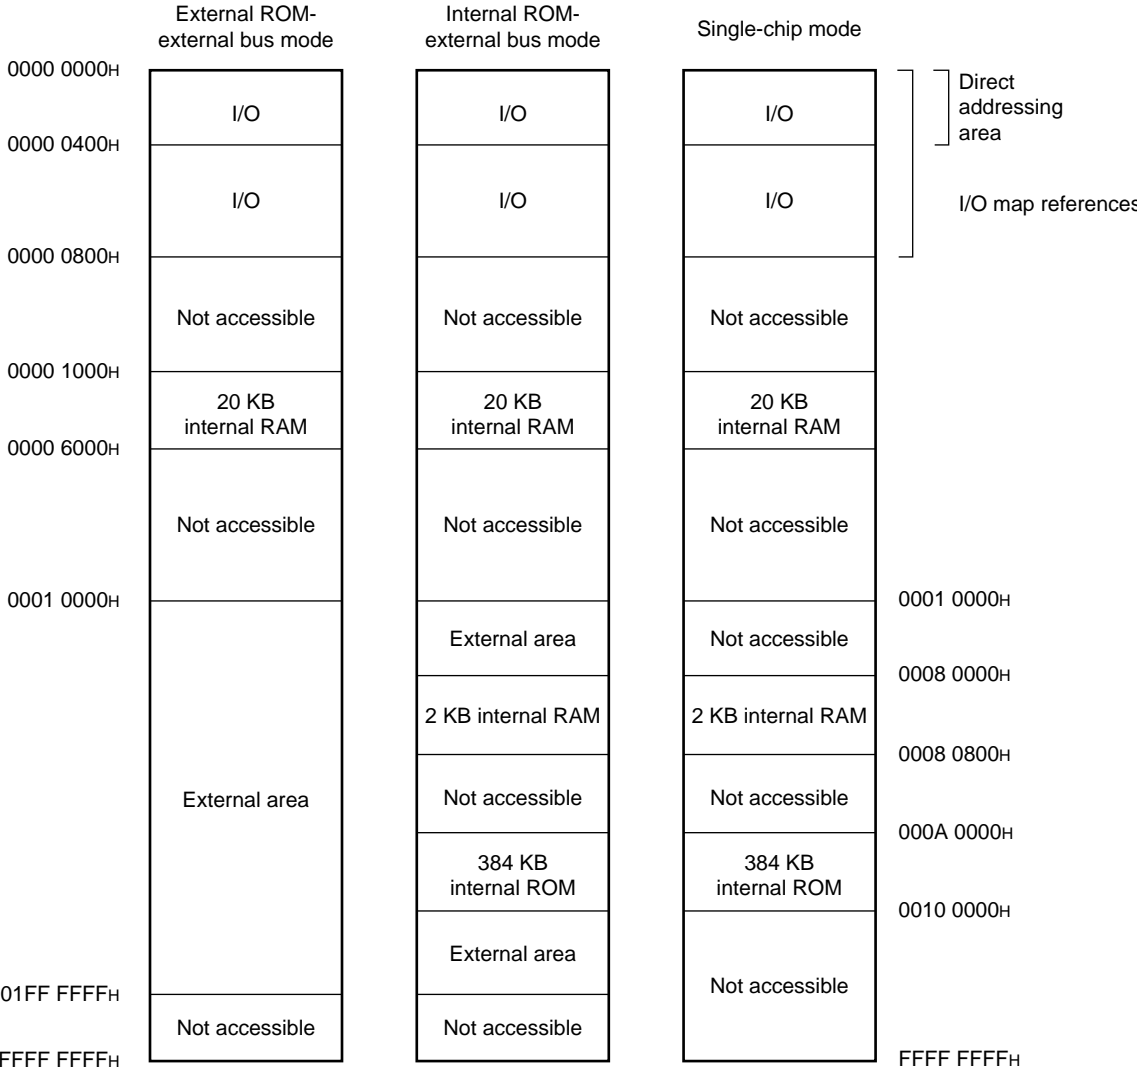

### 2. Memory Map

- **MB91F155 memory space**

Note : External areas are not accessible in single-chip mode.

**• MB91154 Memory Space**

Note : External areas are not accessible in single-chip mode.

# MB91F155/MB91154

## 3. Registers

The family of FR microcontrollers has two types of registers : the registers residing in the CPU which are dedicated to applications and the general-purpose registers residing in the memory.

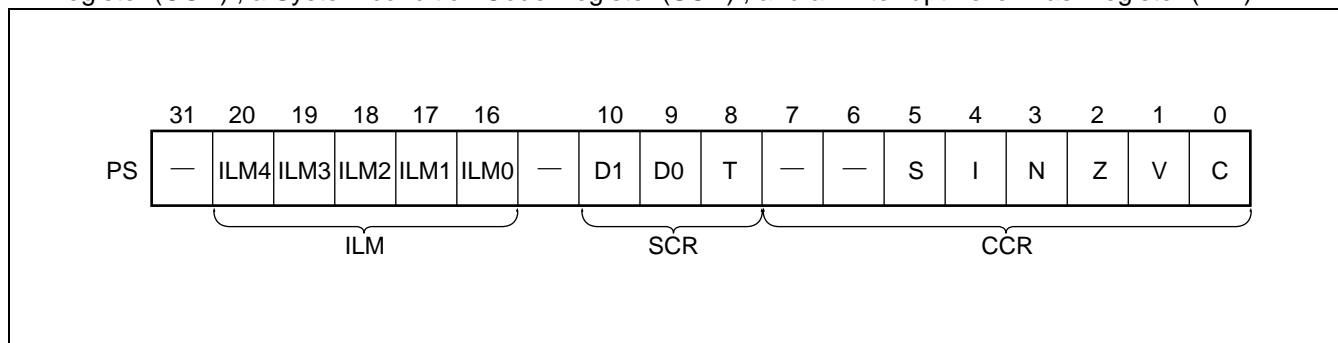

### • Dedicated registers :

- Program counter (PC) : A 32-bit register to indicate the location where an instructions is stored.
- Program status (PS) : A 32-bit register to store a register pointer or a condition code.
- Tablebase register (TBR) : Holds the vector table lead address used when EIT (exceptions/interrupt/ trap) is processed.
- Return pointer (RP) : Holds the address to return from a subroutine to.
- System stack pointer (SSP) : Points to the system stack space.
- User stack pointer (USP) : Points to the user stack space.
- Multiplication and division result register (MDH/MDL) : A 32-bit multiplication and division register.

Register Name	Description	Initial value
PC	Program counter	XXXX XXXXH (Undefined)
PS	Program status	
TBR	Tablebase register	000F FC00H
RP	Return pointer	XXXX XXXXH (Undefined)
SSP	System stack pointer	0000 0000H
USP	User stack pointer	XXXX XXXXH (Undefined)
MDH	Multiplication and division register	XXXX XXXXH (Undefined)
MDL		XXXX XXXXH (Undefined)

### • Program status (PS)

The PS register holds program status and is further divided into three registers which are a Condition Code Register (CCR) , a System condition Code Register (SCR) , and an Interrupt Level Mask register (ILM) .

- **Condition Code Register (CCR)**

- S flag : Designates the stack pointer for use as R15.
- I flag : Controls enabling and disabling of user interrupt requests.
- N flag : Indicates the sign when arithmetic operation results are considered to be an integer represented by 2's complement.
- Z flag : Indicates if arithmetic results were "0."
- V flag : Considers the operand used for an arithmetic operation to be an integer represented by 2's complement and indicates if the operation resulted in an overflow.
- C flag : Indicates whether or not an arithmetic operation resulted in a carry or a borrow from the most significant bit.

- **System condition Code Register (SCR)**

- T flag : Designates whether or not to enable step trace trap.

- **Interrupt Level Mask register (ILM)**

- ILM4 to ILM0 : Holds an interrupt level mask value to be used for level masking.  
An interrupt request is accepted only if the corresponding interrupt level among interrupt requests input to the CPU is higher than the value indicated by the ILM register.

ILM4	ILM3	ILM2	ILM1	ILM0	Interrupt level	High-Low
0	0	0	0	0	0	Higher  Lower
					⋮	
0	1	0	0	0	15	
					⋮	
1	1	1	1	1	31	

# MB91F155/MB91154

## ■ GENERAL-PURPOSE REGISTERS

General-purpose registers are CPU registers R0 through R15 and used as accumulators during various operations and as memory access pointers (fields indicating addresses) .

### • Register Bank Configuration

Of the 16 general-purpose registers, the following registers are assumed for specific applications. For this reason, some instructions are enhanced.

- R13 : Virtual accumulator (AC)
- R14 : Frame pointer (FP)
- R15 : Stack pointer (SP)

Initial values to which R0 through R14 are reset are not defined. The initial value of R15 is 0000 0000H (the SSP value) .

## ■ SETTING MODE

### 1. Mode Pins

As shown in Table 1 three pins, MD2, 1, and 0 are used to indicate an operation.

**Table 1 Mode pins and set modes**

Mode pin			Mode name	Reset vector access area	External data bus width	
MD2	MD1	MD0				
0	0	0	External vector mode 0	External	8 bits	External ROM bus mode
0	0	1	External vector mode 1	External	16 bits	
0	1	0	External vector mode 2	External	32 bits	Not available on this product type
0	1	1	External vector mode	Internal	(Mode register)	Single-chip mode
1	—	—	—	—	—	Not available

### 2. Mode Data

The data which the CPU writes to "0000 07FF<sub>H</sub>" after reset is called mode data.

It is the mode register (MODR) that exists at "0000 07FF<sub>H</sub>." Once a mode is set in this register, operations will take place in that mode. The mode register can be written only once after reset.

The mode specified in the register is enabled immediately after it is written.

[bits 7 and 6] : M1, M0

These are bus mode setting bits. Specify the bus mode to be set to after writing to the mode register.

M1	M0	Function	Remarks
0	0	Single-chip mode	
0	1	Internal ROM-external bus mode	
1	0	External ROM-external bus mode	
1	1	—	Setting not allowed

[bits 5 to 0] : \*

These bits are reserved for the system.

"0" should be written to these bits at all times.

# MB91F155/MB91154

## [Precautions When Writing to the MODR]

Before writing to the MODR, be sure to set AMD0 through 5 and determine the bus width in each CS (Chip Select) area.

The MODR does not have bus width setting bits.

The bus width value set with mode pins MD2 through 0 is enabled before writing to the MODR and the bus width value set with BW1 and 0 of AMD0 through 5 is enabled after writing to the MODR.

For example, the external reset vector is normally executed with area 0 (the area where  $\overline{CS0}$  is active) and the bus width at that time is determined by pins MD 2 through 0. Suppose that the bus width is set to 32 or 16 bits in MD2 though 0 but no value is specified in AMD 0. If the MODR is written in this state, area 0 then switches to 8-bit bus mode and operates the bus since the initial bus width in AMD0 is set to 8 bits. This causes a malfunction.

In order to prevent this type of problem, AMD0 through 5 must always be set before writing to the MODR.

## ■ PERIPHERAL RESOURCES

### 1. I/O Port

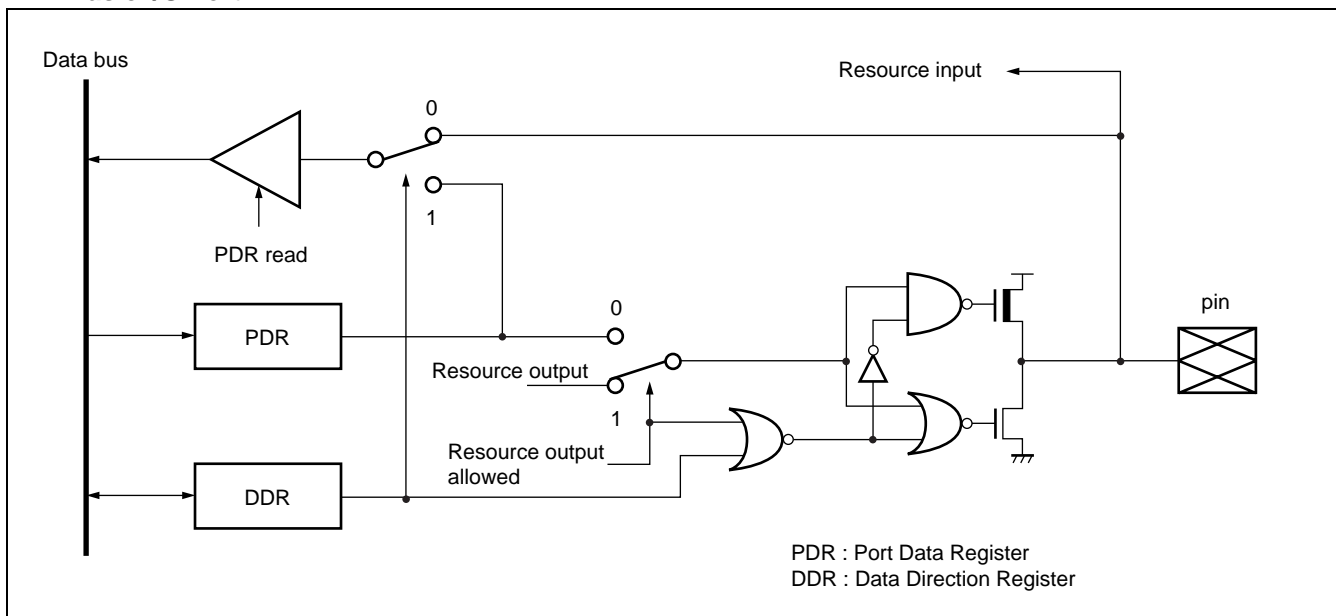

#### (1) Port Block Diagram

This LSI is available as an I/O port when the resource associated with each pin is set not to use a pin for input/output.

The pin level is read from the port (PDR) when it is set for input. When the port is set for output, the value in the data register is read. The same also applies to reload by read modify write.

When switching from input to output, output data is set in the data register beforehand. However, if a read modify write instruction (such as bit set) is used at that time, keep in mind that it is the input data from the pin that is read, not the latch value of the data register.

#### • Basic I/O Port

**Figure PORT-1 Basic port block**

The I/O port consists of the PDR (Port Data Register) and the DDR (Data Direction Register) .

In input mode (DDR = "0") → PDR read : Reads the level of the corresponding external pin.

PDR write : Writes the set value to the PDR.

In output mode (DDR = "1") → PDR read : Reads the PDR value.

PDR write : Outputs the PDR value to the corresponding external pin.

Notes: AIC controls switching between the resource and port of the analog pin (A/D) .

AICK (Analog Input Control register on port-K)

The register controls whether port K should be used for analog input or as a general-purpose port.

0 : General-purpose port

1 : Analog input (A/D)

# MB91F155/MB91154

## • I/O Port (attached with a pullup resistor)

Figure PORT-2 Port block attached with a pullup resistor

### Notes :

- Pullup resistor control register (PCR) R/W  
Controls turning the pullup resistor on/off.  
0 : Pullup resistor disabled  
1 : Pullup resistor enabled
- In stop mode priority is also given to the setting of the pullup resistor control register.
- This function is not available when a relevant pin is in use as an external bus pin. Do not write "1" to this register.

• I/O Port (attached with the open drain output function and a pullup resistor)

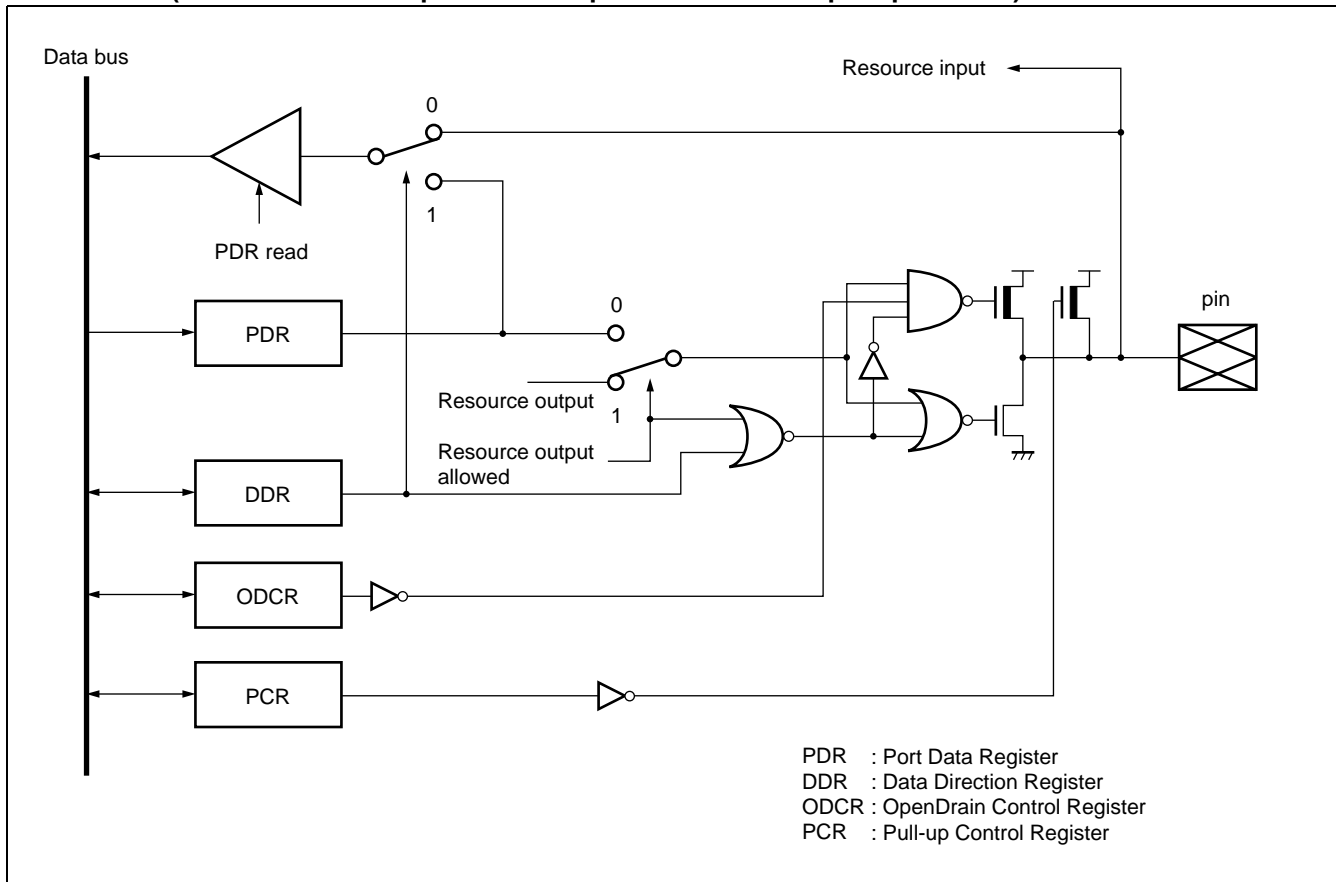

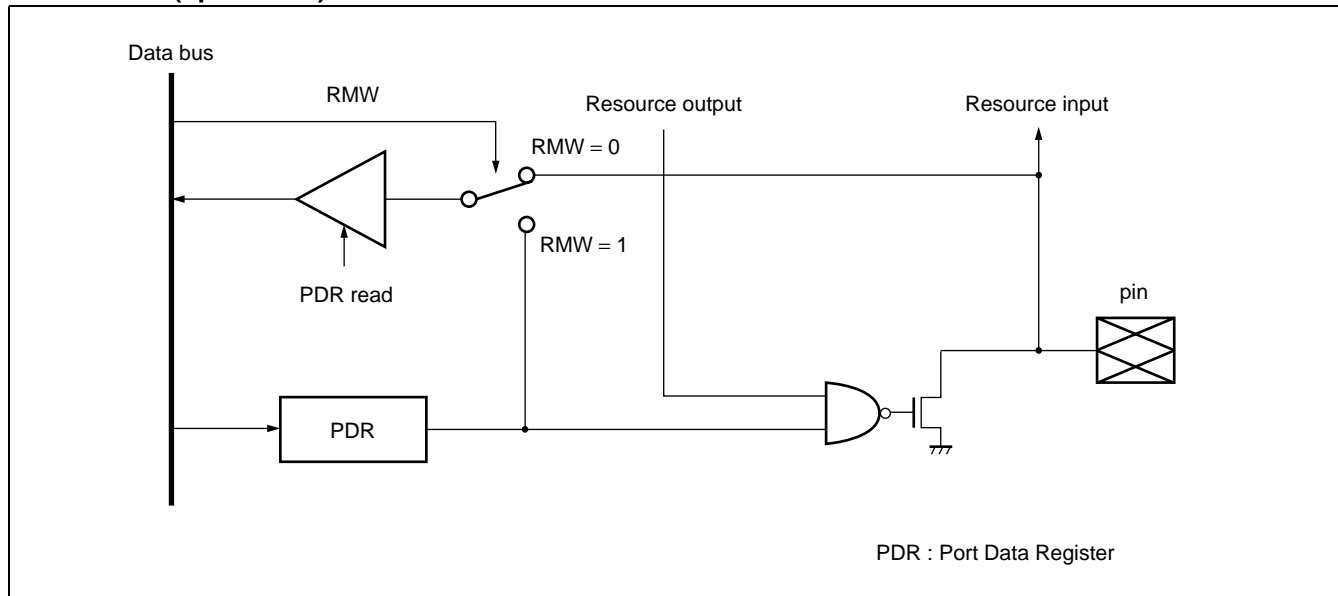

Figure PORT-3 Port block attached with the open drain output function and a pullup resistor

Notes :

- Pullup resistor setup register (PCR) R/W  
Controls turning the pullup resistor on/off.  
0 : Pullup resistor disabled  
1 : Pullup resistor enabled
- Open drain control register (ODCR) R/W  
Controls open drain in output mode.  
0 : Standard output port during output mode  
1 : Open-drain output port during output mode  
This register has no significance in input mode (output Hi-Z) . Input/output mode is determined by the direction register (DDR) .
- Priority is also given to the setting of the pullup resistor control register in stop mode.
- When a relevant pin is used as an external bus pin, neither function is available. Do not write "1" to either register.

# MB91F155/MB91154

## • I/O Port (open drain)

**Figure PORT-4 Port block attached with a pullup resistor**

### Notes :

- When using as an input port or for resource input, set the PDR and resource output to "1."
- During read by RMW, it is the PDR value that is read, not the pin value.

Address : 000106 <sub>H</sub>	PL7	PL6	PL5	PL4	PL3	PL2	PL1	PL0	00000000 <sub>B</sub>	R/W

DDR2 to DDRL control the I/O direction of the I/O port by bit.

DDR = 0 : Port input

DDR = 1 : Port output

Note : DDRI's bit 6 is a test bit. Be sure to write "0" to the bit.

"0" is the value that is read.

R/W: Read/Write enabled, W: Write only, —: Not in use

**• Pull-up Control Register (PCR)**

<b>PCR6</b>								Initial value	Access	
Address : 000631 <sub>H</sub>	7	6	5	4	3	2	1	0	00000000 <sub>B</sub>	R/W
	P67	P66	P65	P64	P63	P62	P61	P60		
<b>PCRC</b>								Initial value	Access	
Address : 0000F7 <sub>H</sub>	7	6	5	4	3	2	1	0	00000000 <sub>B</sub>	R/W
	PC7	PC6	PC5	PC4	PC3	PC2	PC1	PC0		
<b>PCRD</b>								Initial value	Access	
Address : 0000F6 <sub>H</sub>	7	6	5	4	3	2	1	0	00000000 <sub>B</sub>	R/W
	PD7	PD6	PD5	PD4	PD3	PD2	PD1	PD0		
<b>PCRH</b>								Initial value	Access	
Address : 0000F5 <sub>H</sub>	7	6	5	4	3	2	1	0	-- 000000 <sub>B</sub>	R/W
	—	—	PH5	PH4	PH3	PH2	PH1	PH0		
<b>PCRI</b>								Initial value	Access	
Address : 0000F4 <sub>H</sub>	7	6	5	4	3	2	1	0	-- 000000 <sub>B</sub>	R/W
	—	—	PI5	PI4	PI3	PI2	PI1	PI0		

PCR6 to PCRI control the pullup resistor when the corresponding I/O port is in input mode.

PCR = 0 : Pullup resistor not available in input mode

PCR = 1 : Pullup resistor available in input mode

The register has no significance in output mode (a pullup resistor not available) .

**• Open Drain Control Register (ODCR)**

<b>DCRH</b>								Initial value	Access	
Address : 0000F9 <sub>H</sub>	7	6	5	4	3	2	1	0	-- 000000 <sub>B</sub>	R/W
	—	—	PH5	PH4	PH3	PH2	PH1	PH0		
<b>OCRI</b>								Initial value	Access	
Address : 0000F8 <sub>H</sub>	7	6	5	4	3	2	1	0	-- 000000 <sub>B</sub>	R/W
	—	—	PI5	PI4	PI3	PI2	PI1	PI0		

OCRH to OCRI control open drain when the corresponding I/O port is in output mode.

OCR = 0 : Standard output port during output mode

OCR = 1 : Open drain output port during output mode

The register has no significance in input mode (output Hi-z) .

**• Analog Input Control Register (AICR)**

<b>AICK</b>								Initial value	Access	
Address : 0000EB <sub>H</sub>	7	6	5	4	3	2	1	0	00000000 <sub>B</sub>	R/W
	PK7	PK6	PK5	PK4	PK3	PK2	PK1	PK0		

The AICK controls each pin of a corresponding I/O port as follows :

AIC = 1 : Port input mode

AIC = 0 : Analog input mode

The register is reset to "0."

R/W: Read/Write enabled, —: Not in use

# MB91F155/MB91154

## 2. DMA Controller (DMAC)

The DMA controller is a module embedded in FR family devices, and performs DMA (direct memory access) transfer.

DMA transfer performed by the DMA controller transfers data without intervention of CPU, contributing to enhanced performance of the system.

- 8 channels
- Mode: single/block transfer, burst transfer and continuous transfer: 3 kinds of transfer
- Transfer all through the area
- Max. 65536 of transfer cycles
- Interrupt function right after the transfer
- Selectable for address transfer increase/decrease by the software
- External transfer request input pin, external transfer request accept output pin, external transfer complete output pin three pins for each

### • Block Diagram

**• Registers (DMAC internal registers)**

## 3. UART

The UART is a serial I/O port for asynchronous (start and stop synchronization) communication or CLK synchronous communication. Its features are as follows :

- Full-duplex double buffer
- Capable of asynchronous (start and stop synchronization) and CLK synchronous communication.
- Support for multiprocessor mode
- Baud rate by a dedicated baud rate generator
- Baud rate by an internal timer

The baud rate can be set with a 16-bit reload timer.

- Any baud rate can be set using an external clock.
- Error detection function (parity, framing, and overrun)
- NRZ-encoded transfer signals
- DMA transfer can be invoked by interrupt.

## 4. PPG Timer

The PPG timer can output highly accurate PWM waveforms efficiently.

The MB91F155/MB91154 contains six PPG timer channels and its features are as follows :

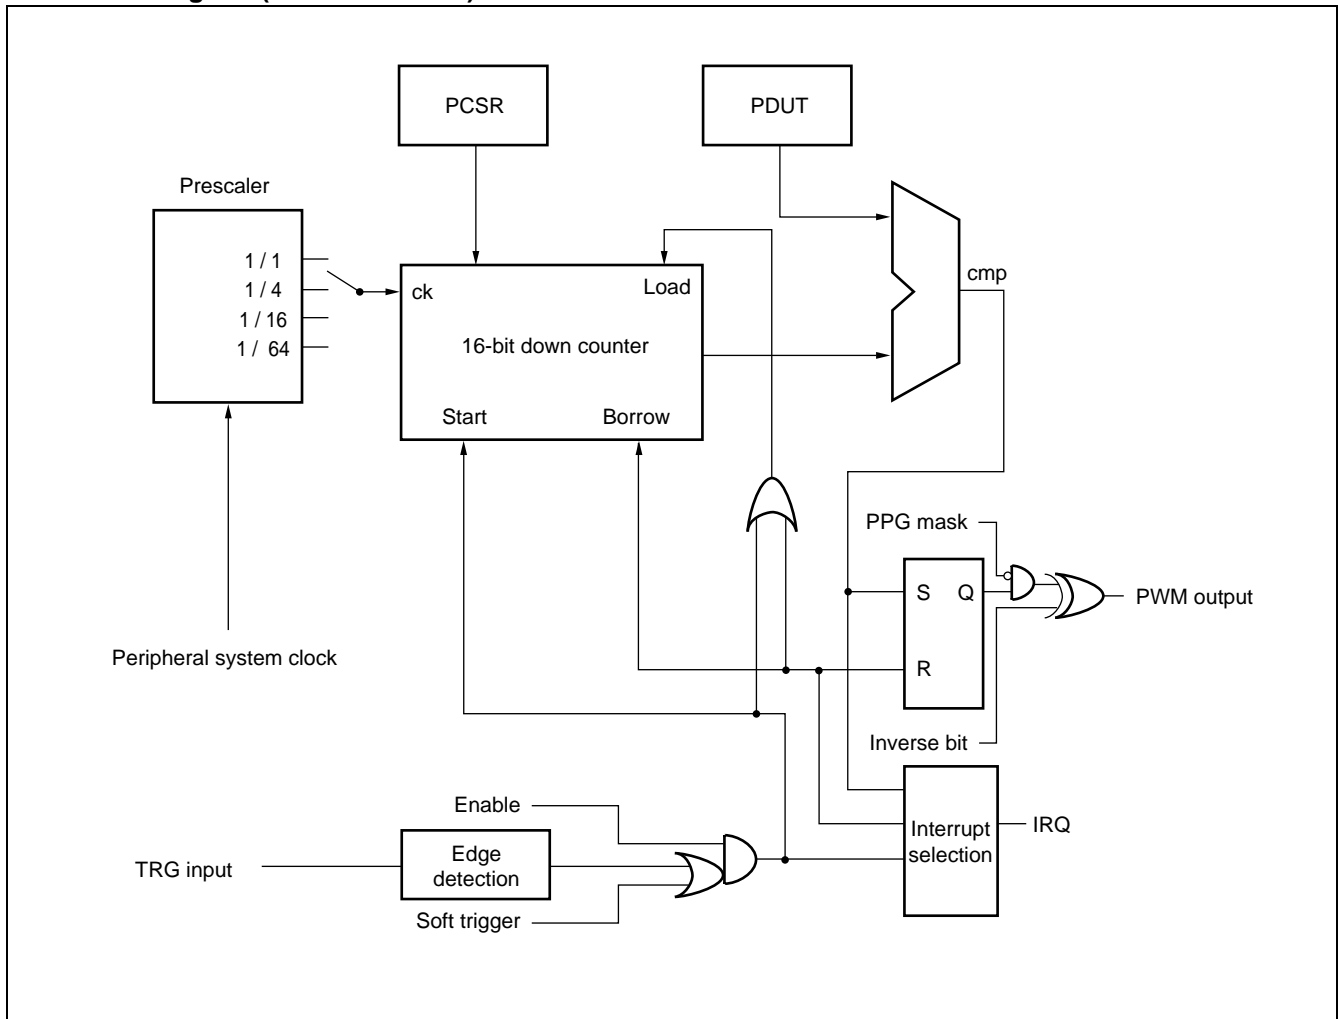

- Each channel consists of a 16-bit down counter, a 16-bit data register attached with a frequency setting buffer, a 16-bit compare register attached with a duty setting buffer, and a pin controller.
- The count clock for the 16-bit down counter can be selected from the following four types :  
Internal clocks  $\phi$ ,  $\phi/4$ ,  $\phi/16$ , and  $\phi/64$
- The counter value can be initialized by reset or counter borrow to “FFFF<sub>H</sub>.”
- PWM output (by channel)
- DMA transfer can be invoked by interrupt.

5. 16-bit Reload Timer

The 16-bit reload timer consists of a 16-bit down counter, a 16-bit reload register, a prescaler for creating internal count clocks, and a control register. The input clock can be selected from three internal clock types (2/8/32 machine clock divisions). DMA transfer can be invoked by interrupt. This product type contains this 16-bit reload timer for four channels.

## 7. 8/10-bit A/D Converter (Sequential Conversion Type)

The A/D converter is a module that converts analog input voltage into a digital value. Its features are as follows :

- A minimum conversion time of 5.0  $\mu\text{s}/\text{ch}$ . (Including sampling time at a 33 MHz machine clock)
- Contains a sample and hold circuit.
- Resolution : 10 or 8 bits selectable.
- Selection of analog input from eight channels by program
  - Single conversion mode : Selects and converts one channel.
  - Continuous conversion mode : Converts a specified channel repeatedly.
  - Stop and convert mode : Stops after converting one channel and stands by until invoked the next time. (Conversion invoking can be synchronized.)
- DMA transfer can be invoked by interrupt.
- Selection of an invoking factor from software, external pin trigger (falling edge) , and 16-bit reload timer (rising edge) .

## 12. External Bus Interface

The external bus interface controls the interface between the external memory and the external I/O. Its features are as follows :

- 24-bit (16 MB) address output
- An 8/16-bit bus width can be set by chip select area.
- Inserts an automatic and programmable memory wait (for seven cycles at maximum) .
- Unused addresses/data pins are available as I/O ports.
- Support for little endian mode
- Use of a clock doubler, 33 MHz internal and 16.5 MHz external bus operations

## 13. Multifunction Timer

The multifunction timer unit consists of one 16-bit free-run timer, eight 16-bit output compare registers, four 16-bit input capture registers, and six 16-bit PPG timer channels. By using this function 12 independent waveforms can be output based on the 16-bit free-run timer and the input pulse width and external clock cycle can also be measured.

### • Timer Components

#### • 16-bit free-run timer ( × 1)

The 16-bit free-run timer consists of a 16-bit up counter, a control register, a 16-bit compare clear register, and a prescaler. The output value of this counter is used as the basic time (base timer) for output compare and input capture.

#### • Output compare ( × 8)

The output compare consists of eight 16-bit compare registers, a compare output latch, and a control register. When the 16-bit free-run timer value agrees to the compare register value, the output level can be inverted and an interrupt can also be generated.

#### • Input capture ( × 4)

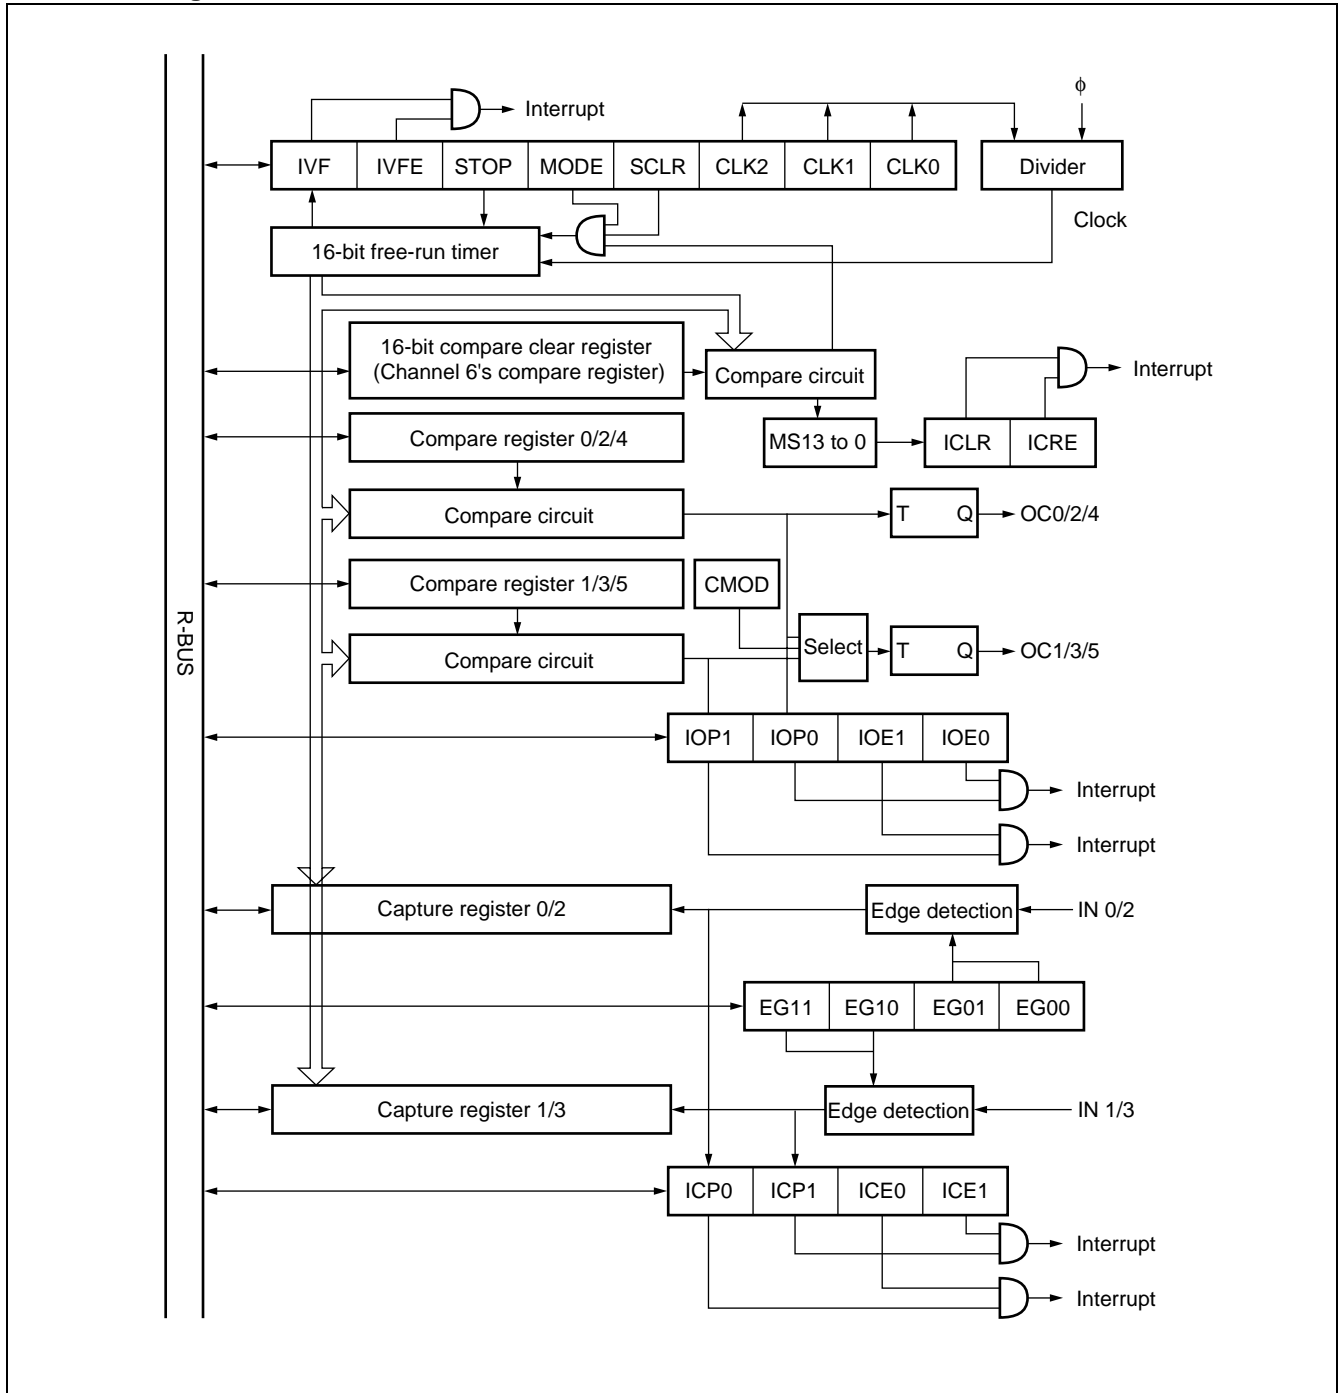

The input capture consists of capture registers corresponding to four independent external input pins and a control register. By detecting any edge of signals input from external input pins, the 16-bit free-run timer value can be held in the capture register and an interrupt can be generated at the same time.

#### • 16-bit PPG timer ( × 6)

See the section on the PPG Timer.

## 14. Calendar Macro • Backup RAM

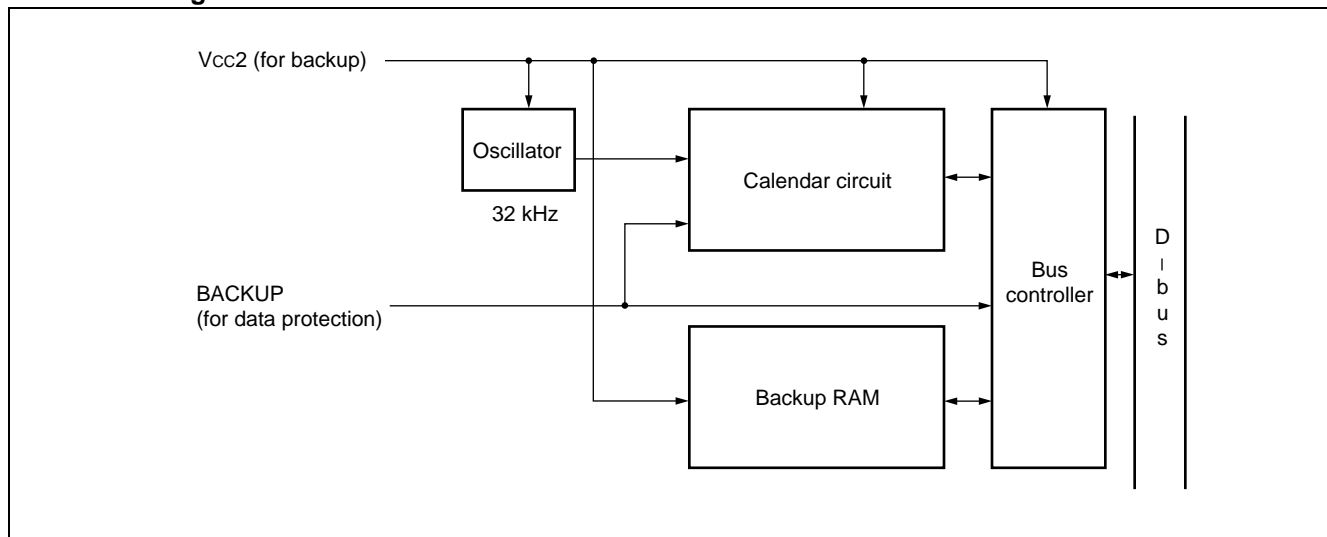

This macro is a calendar macro with a basic clock of 32.768 kHz.

The macro accomplishes clock functions including, year, month, date, hour, minutes, seconds, day of the week, and leap years.

The macro counts the last two digits of calendar years 0 through 99.

A backup RAM is also contained.

## 15. I<sup>2</sup>C Interface

The I<sup>2</sup>C interface is a serial I/O port that supports the Inter IC BUS and operates as a master/slave device on the I<sup>2</sup>C bus.

### • Features of the I<sup>2</sup>C Interface

Contains one I<sup>2</sup>C interface channel.

The interface has the following features :

- Master/slave send and receive
- Arbitration function
- Clock synchronization function
- Slave address/general call address detection function
- Transfer direction detection function
- Repeated generation and detection of start conditions
- Bus error detection function

## 16. FLASH Memory

The MB91F155 contains a 510-Kbyte (4 Mbits) flash memory of which the sectors can be erased all at once or sector by sector and that can be written with the FR-CPU by half word (16 bits) using a single 0.3 V power supply.

The MB91F155 accomplishes the following functions by a combination of the flash memory macro and the FR-CPU interface circuit :

- Functions as the CPU program/data storage memory :  
When used as a ROM, the memory is accessible with a 32-bit bus width.  
Allows the CPU to read from/write to/erase the memory (automatic program algorithm\*).
- Functions equivalent to the stand-alone MBM29LV400C flash memory product :  
Allows a ROM programmer to read from/write to/erase the memory (automatic program algorithm\*)

At this time, using the flash memory from the FR-CPU is described. For detailed information about using the flash memory from the ROM programmer, refer to the ROM programmer instruction manual.

\* : Automatic program algorithm = Embedded Algorithm™  
Embedded Algorithm™ is a trademark of Advanced Micro Devices, Inc.

• **Registers**

**FLCR : Status register (CPU mode)**

This register indicates the FLASH memory operating status. The register controls interrupts to the CPU as well as writing to the FLASH memory.

This register is accessible only in CPU mode. Do not access this register with read modify write instructions.

	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0

## 17. 8-bit D/A Converter

This block is of an 8-bit resolution, R-2R D/A converter. The block contains three D/A converter channels and each D/A control register can control output independently. The D/A converter pin is a dedicated pin.

## 18. 8/16-bit Up/Down Counters/Timers

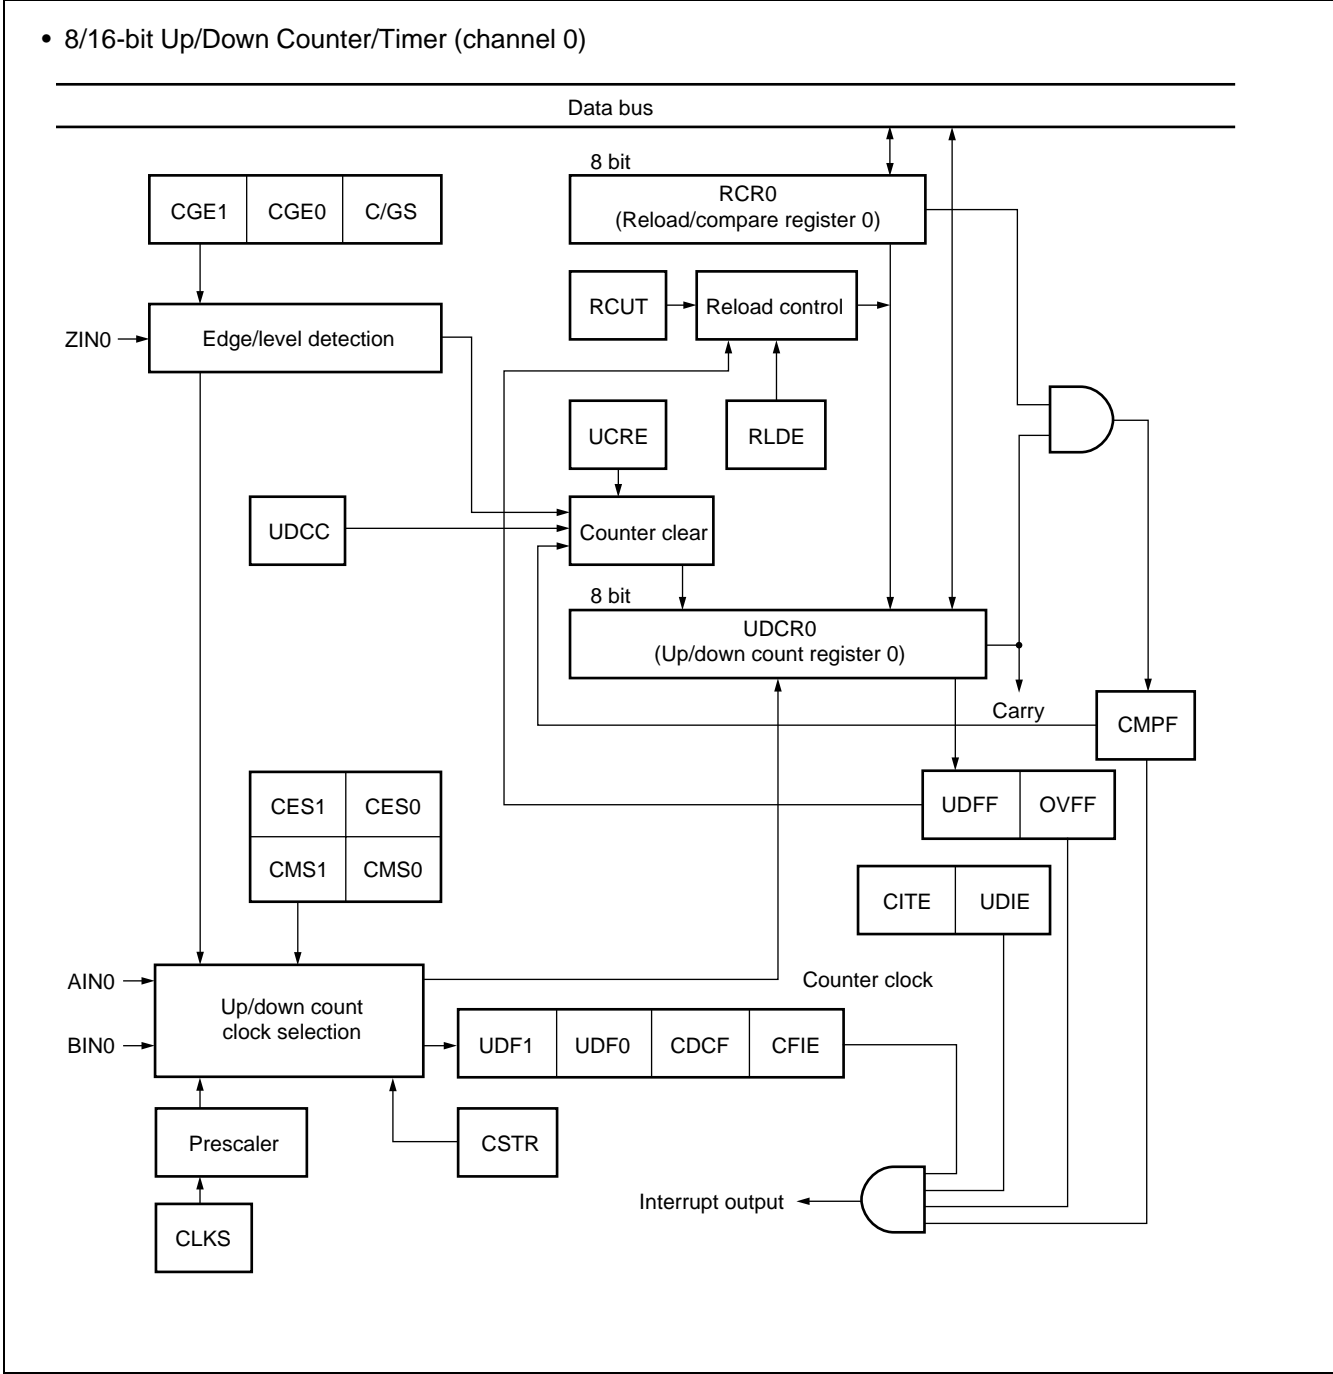

This is the up/down counter/timer block consisting of six event input pins, two 8-bit up/down counters, two 8-bit reload/compare registers, and their control circuits.

The features of this module are as follows :

- Capable of counting in the (0) d- (256) d range by the 8-bit count register.  
(In 16-bit  $\times$  1 operating mode, the register can count in the (0) d- (65535) d range.)
- Four count modes to choose from by the count clock.
- In timer mode the count clock can be selected from two internal clock types.
- In up/down count mode an external pin input signal detection edge can be selected.
- The phase-difference count mode is suitable for encoder counting, such as of motors. Rotation angles, rotating speeds, and so on can be counted accurately and easily by inputting the output of phases A, B, and Z.
- Two types of function to choose from for the ZIN pin. (Enabled in all modes)
- Equipped with compare and reload functions which can be used individually or in combination. When combined, these functions can count up/down at any width.
- The immediately preceding count direction can be identified by the count direction flag.
- Capable of individually controlling interrupt generation when comparison results match, at occurrence of reload (underflow) or overflow, or when the count direction changes.

## ■ ELECTRICAL CHARACTERISTICS

### 1. Absolute Maximum Ratings

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	$V_{CC}, V_{CC2}$	$V_{SS} - 0.3$	$V_{SS} + 3.6$	V	
Analog supply voltage	$AV_{CC}$	$V_{SS} - 0.3$	$V_{SS} + 3.6$	V	*1
Analog reference voltage	$AV_{RH}$	$V_{SS} - 0.3$	$V_{SS} + 3.6$	V	*1
Input voltage	$V_I$	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
Input voltage (open drain port J)	$V_{I2}$	$V_{SS} - 0.3$	$V_{SS} + 5.5$	V	
Analog pin input voltage	$V_{IA}$	$V_{SS} - 0.3$	$AV_{CC} + 0.3$	V	
Output voltage	$V_O$	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
"L" level maximum output current	$I_{OL}$	—	10	mA	*2
"L" level average output current	$I_{OLAV}$	—	4	mA	*3
"L" level total maximum output current	$\Sigma I_{OL}$	—	100	mA	
"L" level total average output current	$\Sigma I_{OLAV}$	—	50	mA	*4
"H" level maximum output current	$I_{OH}$	—	-10	mA	*2
"H" level average output current	$I_{OHAV}$	—	-4	mA	*3
"H" level total maximum output current	$\Sigma I_{OH}$	—	-50	mA	
"H" level total average output current	$\Sigma I_{OHAV}$	—	-20	mA	*4
Power consumption	$P_D$	—	500	mW	
Operating temperature	$T_A$	0	+70	°C	
Storage temperature	$T_{stg}$	-55	+150	°C	

\*1 : Take care not to exceed  $V_{CC} + 0.3\text{ V}$  when turning on the power, for example.

Take care also to prevent  $AV_{CC}$  from exceeding  $V_{CC}$  when turning on the power, for example.

\*2 : The maximum output current stipulates the peak value of a single concerned pin.

\*3 : The average output current stipulates the average current flowing through a single concerned pin over a period of 100 ms.

\*4 : The total average output current stipulates the average current flowing through all concerned pins over a period of 100 ms.

**WARNING:** Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

# MB91F155/MB91154

## 2. Recommended Operating Conditions

( $V_{SS} = AV_{SS} = 0.0\text{ V}$ )

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	$V_{CC}, V_{CC2}$	3.15	3.6	V	During normal operations.
		2.0	3.6		The RAM state is retained when stopped.
Analog supply voltage	$AV_{CC}$	$V_{SS} + 3.15$	$V_{SS} + 3.6$	V	
Analog reference voltage	$AV_{RH}$	$AV_{SS}$	$AV_{CC}$	V	
Operating temperature	$T_A$	0	+70	°C	

**WARNING:** The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

### 3. DC Characteristics

( $V_{CC} = V_{CC2} = 3.15\text{ V}$  to  $3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_A = 0\text{ }^\circ\text{C}$  to  $+70\text{ }^\circ\text{C}$ )

# MB91F155/MB91154

## 5. AC Characteristics

### (1) Clock Timing Ratings

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Clock frequency (high speed and self oscillation)	f <sub>c</sub>	X0, X1	—	10	16.5	MHz	Range in which self oscillation is allowed
Clock frequency (high speed and PLL in use)			—				Range in which self oscillation and the use of the PLL for external clock input are allowed
Clock frequency (High speed an 1/2 division input)			—	10	18	MHz	Range in which external clocks can be input
Clock frequency (for the calendar macro)	f <sub>CA</sub>	X0A, X1A	—	32		kHz	Self oscillation and external clocks
Clock cycle time	t <sub>c</sub>	—	—	30.3	1600*4	ns	
Frequency regulation *1 (When the PLL is locked.)	Δf	—	—	—	10	%	
Internal operating clock frequency	CPU system	f <sub>CP</sub>	One wait is set with the wait controller.	0.625*4	33	MHz	
	Bus system	f <sub>CPB</sub>		0.625*4	25*3		
	Peripheral system	f <sub>CPP</sub>		0.625*4	33		Analog section excluded. *2
				1	33		Analog section *2
Internal operating clock cycle time	CPU system	t <sub>CP</sub>	—	30.3	1600*4	ns	
	Bus system	t <sub>CPB</sub>		40*3	1600*4		
	Peripheral system	t <sub>CPP</sub>		30.3	1600*4		Analog section excluded. *2
				30.3	1000		section *2

\*1 : Frequency regulation is the maximum fluctuation from a set center frequency, represented in percentage, when locked to a multiple.

\*2 : The target analog section is the A/D.

\*3 : The maximum external bus operating frequency allowed is 25 MHz.

\*4 : The value when a minimum clock frequency of 10 MHz is input to X0 and half a division of the oscillator circuit and the 1/8 gear are in use.

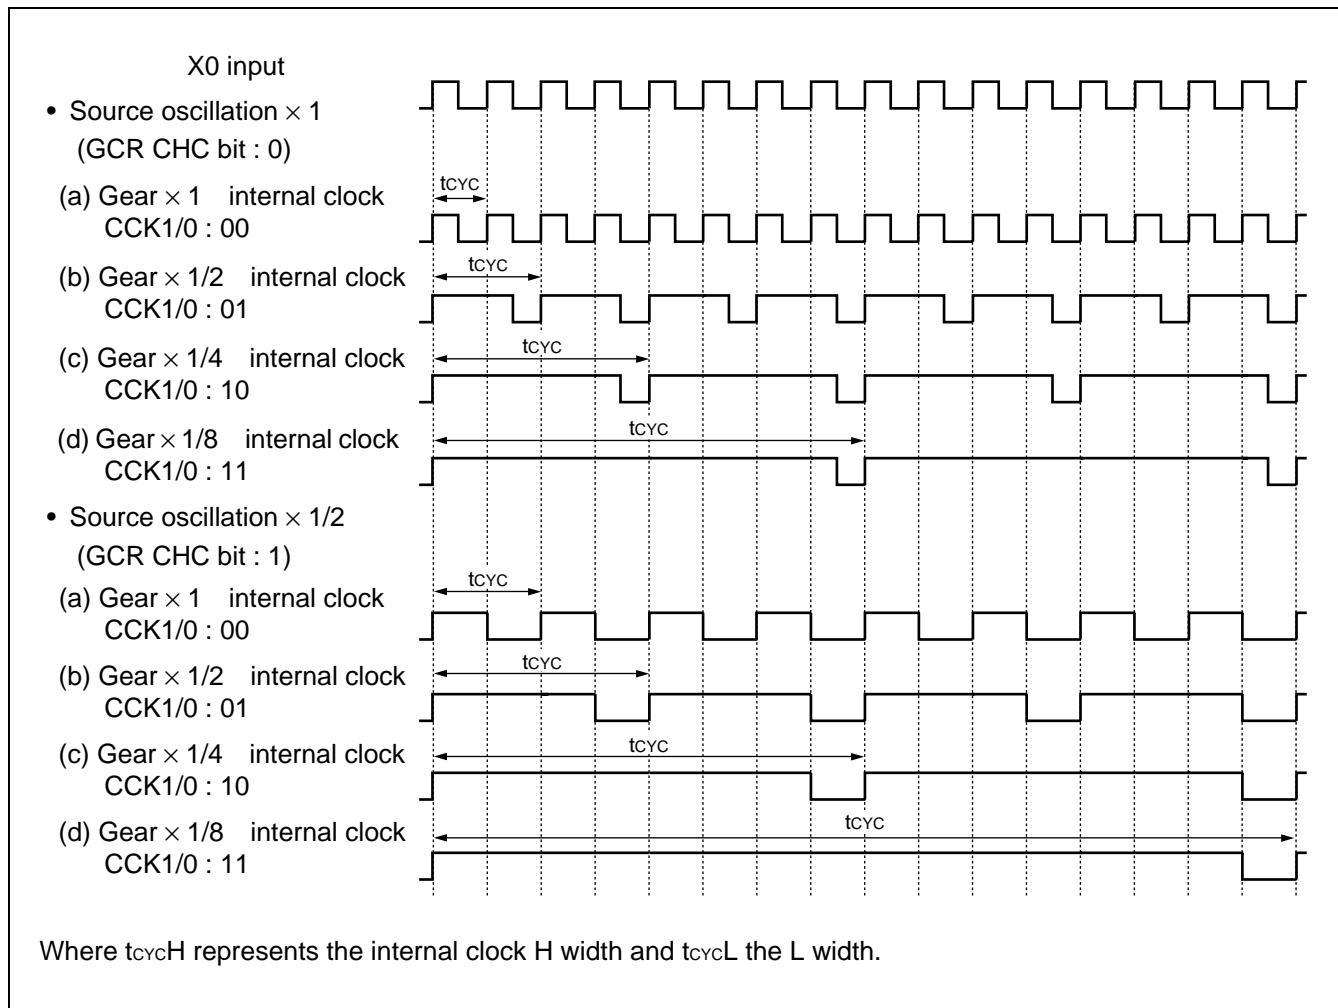

$$\Delta f = \frac{|\alpha|}{f_0} \times 100 (\%)$$

# MB91F155/MB91154

The relationship between the X0 input and the internal clock set with the CHC/CCK1/CCK0 bit of the GCR (Gear Control Register) is as shown next.

## (2) Reset Input Ratings

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

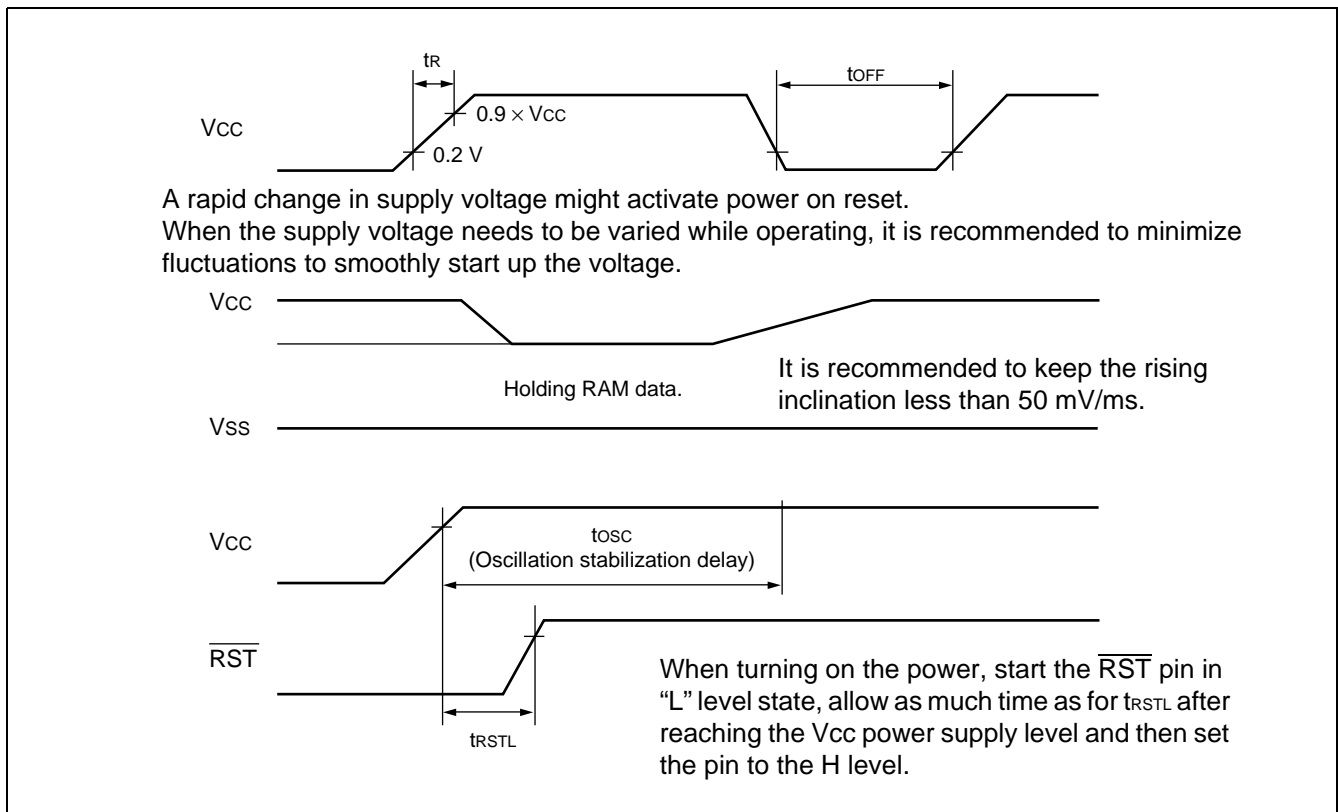

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Reset input time	$t_{RSTL}$	$\overline{RST}$	—	$t_{CP} \times 5$	—	ns	

## (3) Power On Reset

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power supply rising time	$f_R$	$V_{CC}$	—	—	20	ms	$V_{CC} < 0.2 \text{ V}$ before turning up the power.
Power supply cutoff time	$t_{OFF}$			2	—	ms	
Oscillation stabilization delay	$t_{OSC}$	—		$2^{14} t_c$	—	ns	

# MB91F155/MB91154

## (4) Serial I/O (CH0-4)

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Serial clock cycle time	$t_{SCYC}$	—	Internal clock	$8 t_{CPP}$	—	ns	
SCK $\downarrow \rightarrow$ SO delay time	$t_{SLOV}$	—		-10	50	ns	
Valid SI $\rightarrow$ SCK $\uparrow$	$t_{IVSH}$	—		50	—	ns	
SCK $\uparrow \rightarrow$ valid SI hold time	$t_{SHIX}$	—		50	—	ns	
Serial clock "H" pulse width	$t_{SHSL}$	—	External clock	$4 t_{CPP} - 10$	—	ns	
Serial clock "L" pulse width	$t_{LSLH}$	—		$4 t_{CPP} - 10$	—	ns	
SCK $\downarrow \rightarrow$ SO delay time	$t_{SLOV}$	—		0	50	ns	
Valid SI $\rightarrow$ SCK $\uparrow$	$t_{IVSH}$	—		50	—	ns	
SCK $\uparrow \rightarrow$ valid SI hold time	$t_{SHIX}$	—		50	—	ns	
Serial busy period	$t_{BUSY}$	—		—	$6 t_{CPP}$	ns	
SCS $\downarrow \rightarrow$ SCK and SO delay time	$t_{CLZO}$	—		—	50	ns	
SCS $\downarrow \rightarrow$ SCK input mask time	$t_{CLSL}$	—		—	$3 t_{CPP}$	ns	
SCS $\uparrow \rightarrow$ SCK and SO Hi-Z time	$t_{CHOZ}$	—	50	—	ns		

### Internal shift clock mode

### External shift clock mode

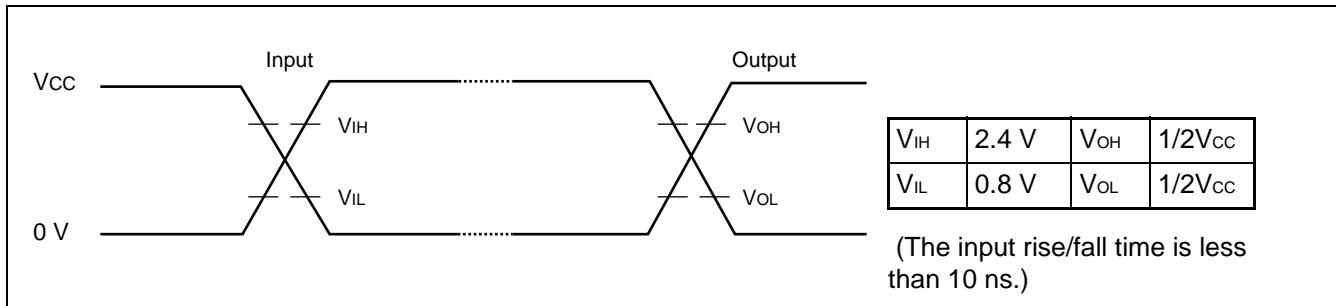

## (5) External Bus Measurement Conditions

The following conditions apply to items that are not specifically stipulated.

- AC characteristics measurement conditions

$V_{CC} : 3.3 \text{ V}$

- Load condition

# MB91F155/MB91154

## (6) Normal Bus Access and Read/Write Operations

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

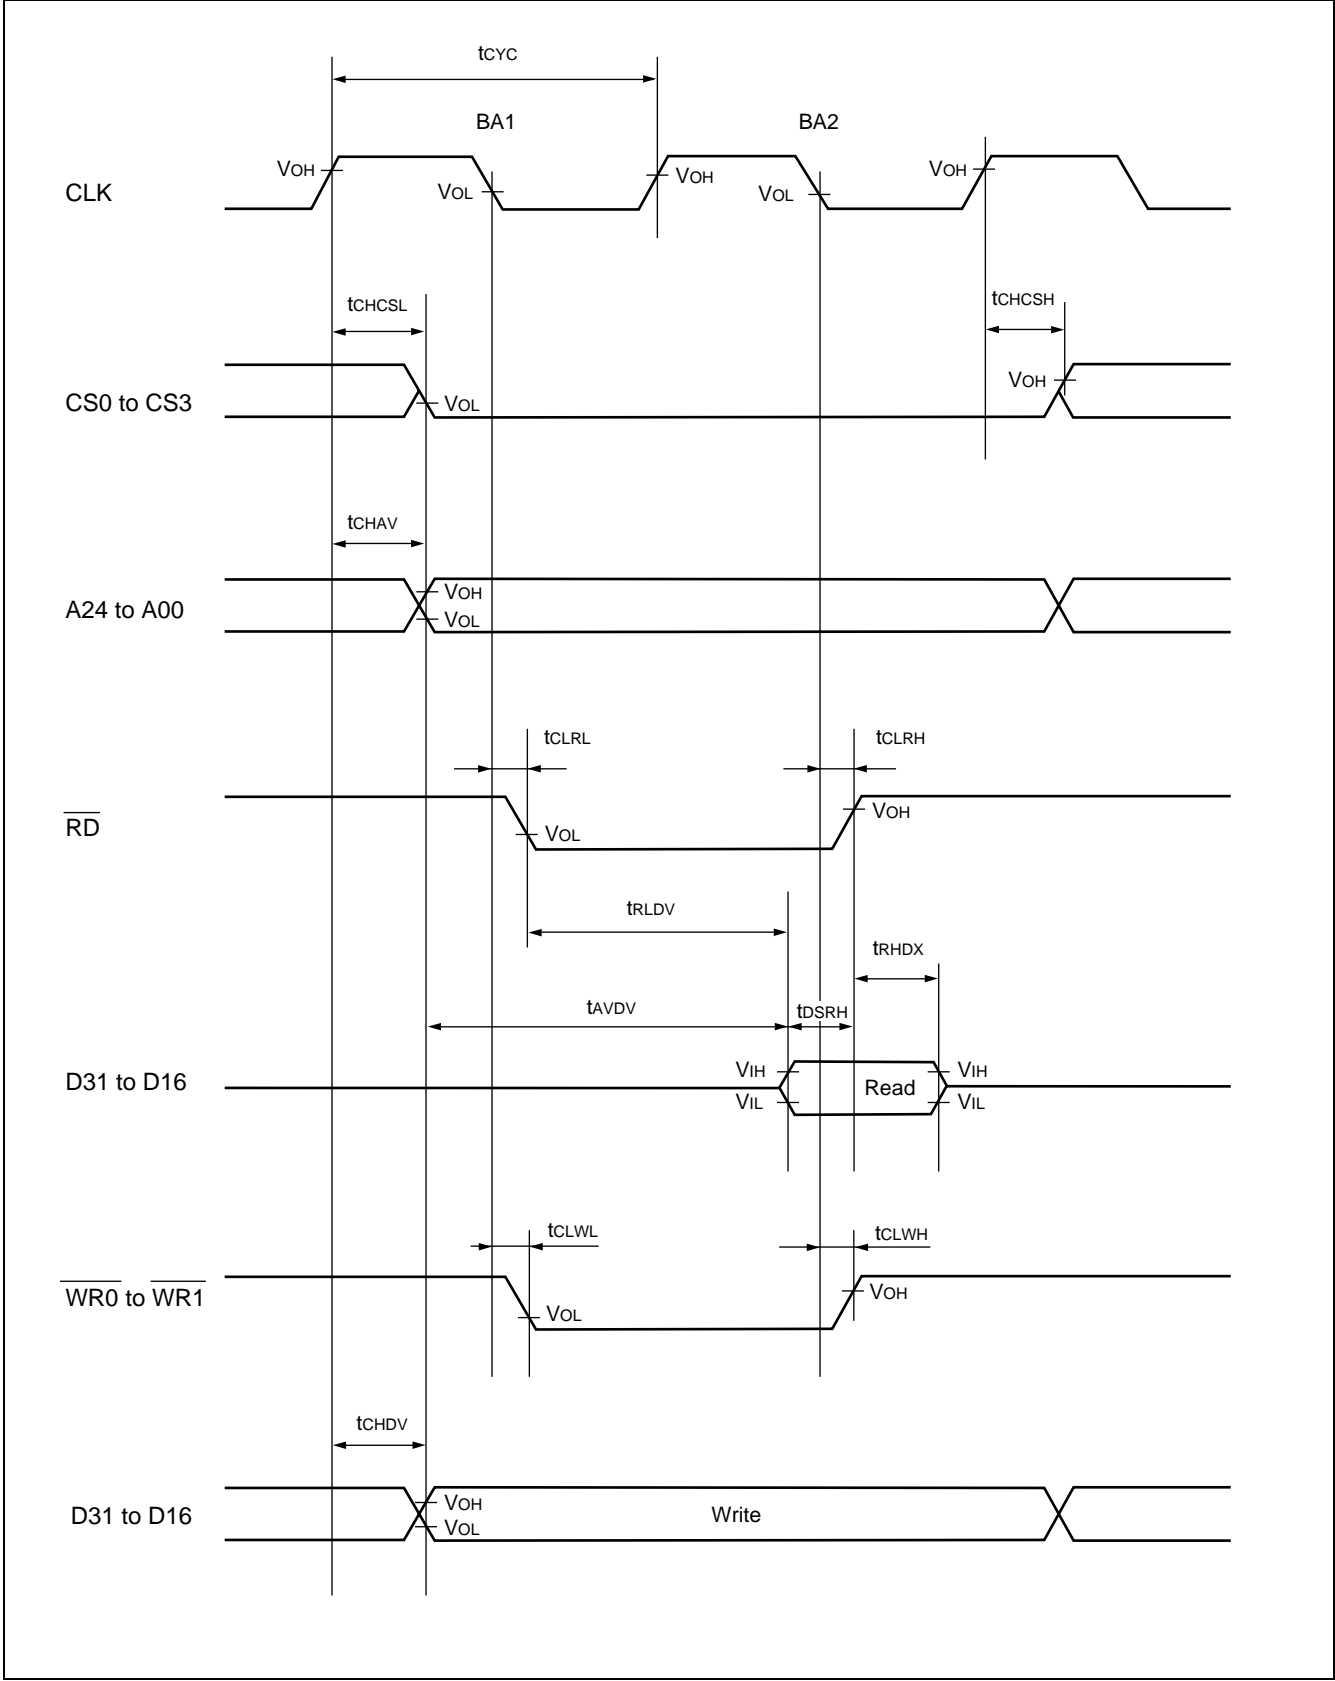

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
CS 0 - 3 delay time	$t_{CHCSL}$	CLK CS0 to 3	—	—	15	ns	
CS 0 - 3 delay time	$t_{CHCSH}$			—	15	ns	
Address delay time	$t_{CHAV}$	CLK A24 to A00		—	15	ns	
Data delay time	$t_{CHDV}$	CLK D31 to D16		—	15	ns	
$\overline{RD}$ delay time	$t_{CLRL}$	CLK $\overline{RD}$		—	10	ns	
$\overline{RD}$ delay time	$t_{CLRH}$			—	10	ns	
$\overline{WR0} - \overline{1}$ delay time	$t_{CLWL}$	CLK $\overline{WR0}$ to $\overline{1}$		—	10	ns	
$\overline{WR0} - \overline{1}$ delay time	$t_{CLWH}$			—	10	ns	
Valid address → valid data input time	$t_{AVDV}$	A24 to A00 D31 to D16		—	$3 / 2 \times$ $t_{CYC} - 40$	ns	*1, *2
$\overline{RD} \downarrow \rightarrow$ valid data input time	$t_{RLDV}$	$\overline{RD}$ D31 to D16		—	$t_{CYC} - 25$	ns	*1
Data setup → $\overline{RD} \uparrow$ time	$t_{DSRH}$		25	—	ns		
$\overline{RD} \uparrow \rightarrow$ Rdata hold time	$t_{RHDX}$		0	—	ns		

\*1 : If the bus is extended with either automatic wait insertion or RDY input, add the ( $t_{CYC} \times$  the number of extended cycles) time to this value.

\*2 : This is the value at the time of (gear cycle  $\times$  1) .

When the gear cycle is set to 1/2, 1/4 or 1/8, substitute "n" in the following formula with 1/2, 1/4 or 1/8 respectively.

$$\text{Formula : } (2 - n / 2) \times t_{CYC} - 40$$

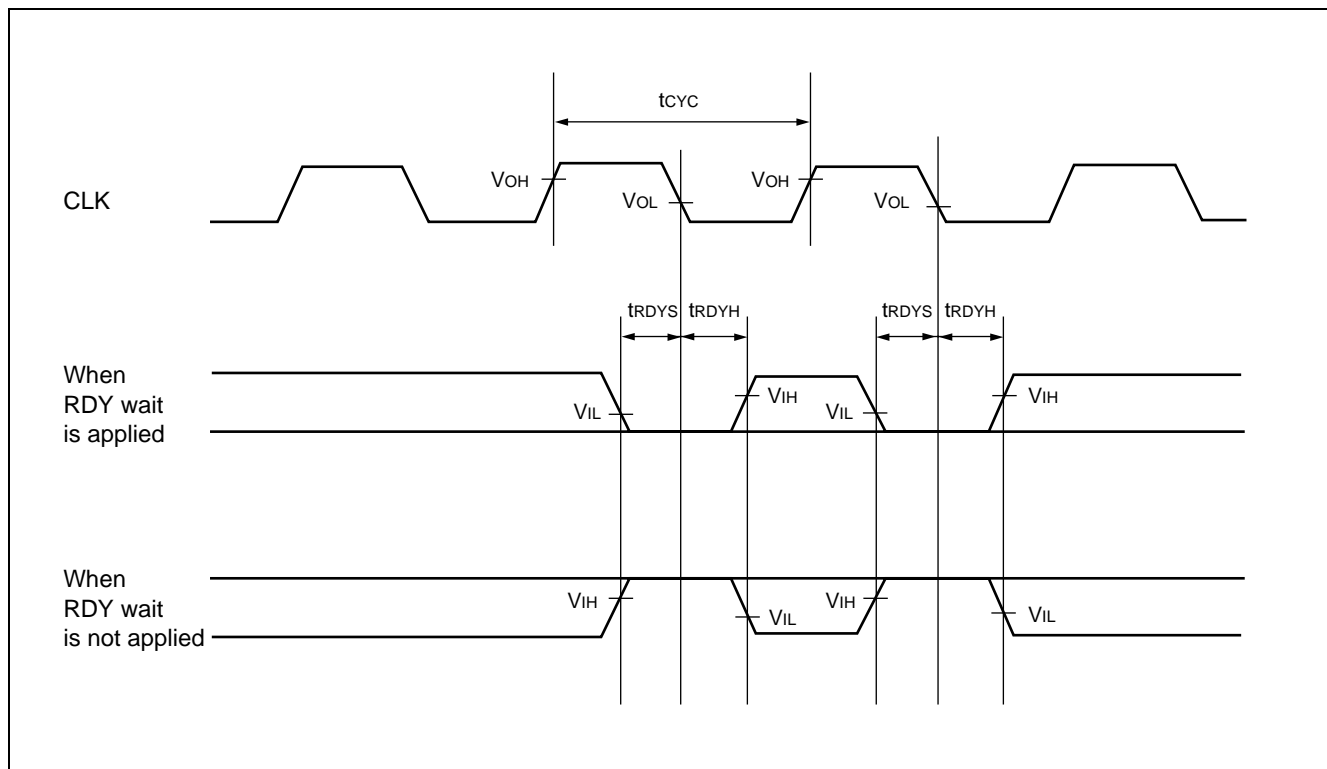

# MB91F155/MB91154

## (7) Ready Input Timing

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
RDY setup time $\rightarrow$ CLK $\downarrow$	$t_{RDYS}$	RDY CLK	—	20	—	ns	
CLK $\downarrow$ $\rightarrow$ RDY hold time	$t_{RDYH}$	RDY CLK		0	—	ns	

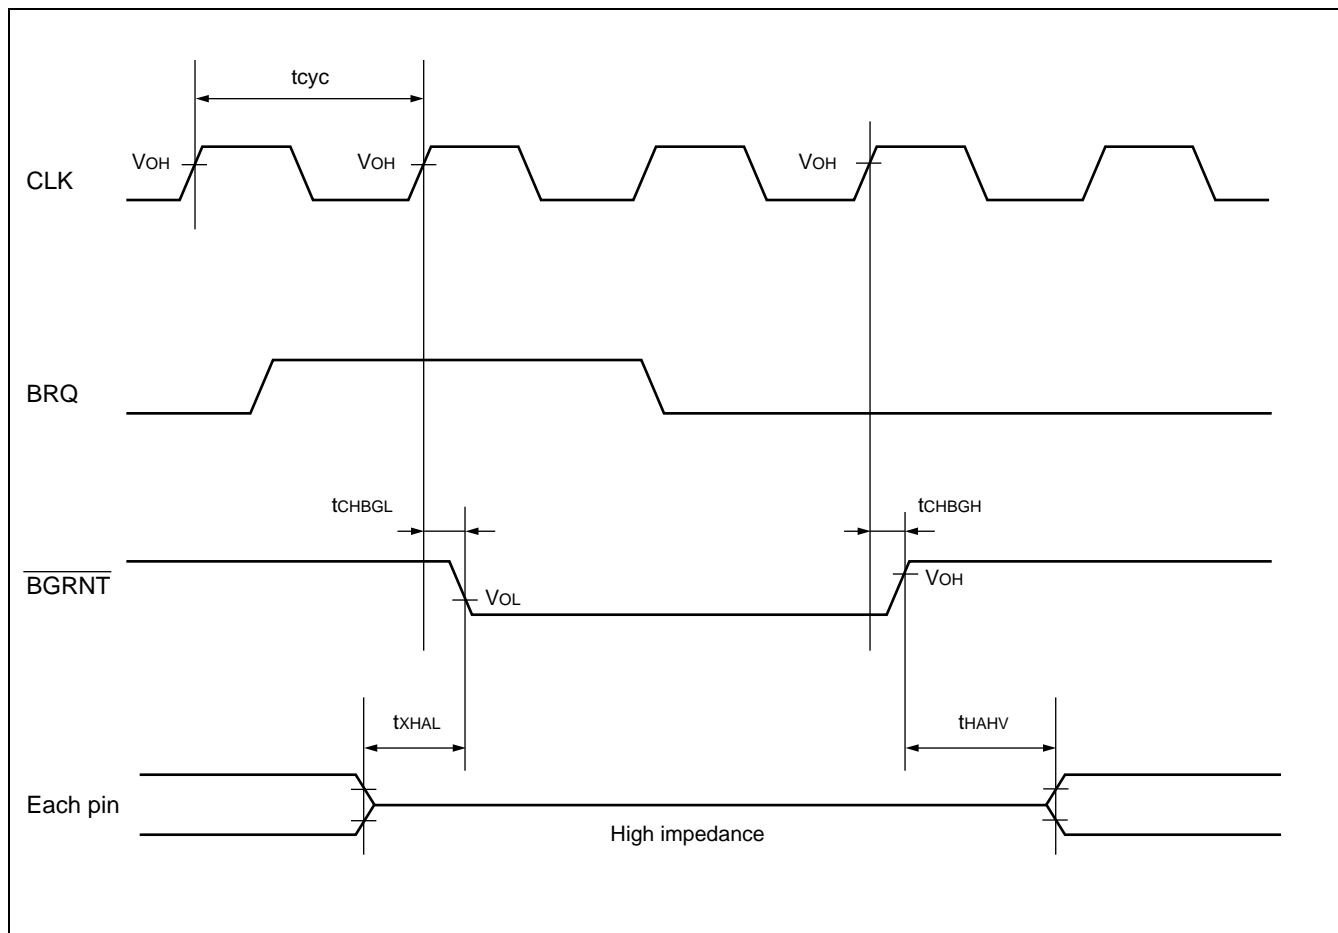

## (8) Hold Timing

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
BGRNT $\bar$ delay time	$t_{CHBGL}$	CLK	—	—	10	ns	
BGRNT $\bar$ delay time	$t_{CHBGH}$	BGRNT $\bar$		—	10	ns	
Pin floating $\rightarrow$ BGRNT $\bar$ $\downarrow$ time	$t_{XHAL}$	BGRNT $\bar$		$t_{CYC} - 10$	$t_{CYC} + 10$	ns	
BGRNT $\bar$ $\uparrow$ $\rightarrow$ Pin valid time	$t_{HAHV}$			$t_{CYC} - 10$	$t_{CYC} + 10$	ns	

Note : More than one cycle exist after BRQ is fetched and before BGRNT $\bar$  changes.

# MB91F155/MB91154

## (9) DMA Controller Timing

( $V_{CC} = V_{CC2} = 3.15 \text{ V to } 3.6 \text{ V}$ ,  $V_{SS} = AV_{SS} = 0 \text{ V}$ ,  $T_A = 0 \text{ }^\circ\text{C to } +70 \text{ }^\circ\text{C}$ )

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
DREQ input pulse width	$t_{DRWH}$	DREQ0 to 2	—	$2 t_{CYC}$	—	ns	
DACK delay time (typical bus) (typical DRAM)	$t_{CLDL}$	CLK DACK0 to 2		—	6	ns	
	$t_{CLDH}$			—	6	ns	
EOP delay time (typical bus) (typical DRAM)	$t_{CLEL}$	CLK EOP0 to 2		—	6	ns	
	$t_{CLEH}$			—	6	ns	
DACK delay time (Single Dram) (Hyper Dram)	$t_{CHDL}$	CLK DACK0 to 2		—	$n / 2 \times t_{CYC}$	ns	
	$t_{CHDH}$			—	6	ns	
EOP delay time (Single Dram) (Hyper Dram)	$t_{CHEL}$	CLK EOP0 to 2		—	$n / 2 \times t_{CYC}$	ns	
	$t_{CHEH}$		—	6	ns		

## 6. A/D Converter Electrical Characteristics

( $V_{CC} = V_{CC2} = 3.15\text{ V to } 3.6\text{ V}$ ,  $V_{SS} = AV_{SS} = 0\text{ V}$ ,  $T_A = 0\text{ °C to } +70\text{ °C}$ )

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks	
				Min.	Typ.	Max.			
Resolution	—	—	—	—	—	10	Bit		
Conversion time	—	—		5.1	—	—	μs		
Total error	—	—	$AV_{CC} = 3.3\text{ V}$ , $AV_{RH} = 3.3\text{ V}$	—	—	±4.0	LSB		
Linearity error	—	—		—	—	±3.5	LSB		
Differential linearity error	—	—		—	—	±2.0	LSB		
Zero transition error	$V_{OT}$	AN0 to AN7	$AV_{CC} = 3.3\text{ V}$ , $AV_{RH} = 3.3\text{ V}$	$AV_{SS} - 1.5$	$AV_{SS} + 0.5$	$AV_{SS} + 2.5$	LSB		
Full-scale transition error	$V_{FST}$	AN0 to AN7		$AV_{RH} - 5.5$	$AV_{RH} - 1.5$	$AV_{RH} + 0.5$	LSB		
Analog input current	$I_{AIN}$	AN0 to AN7	—	—	0.1	10	μA		
Analog input voltage	$V_{AIN}$	AN0 to AN7		$AV_{SS}$	—	$AV_{RH}$	V		
Reference voltage	$AV_{RH}$	$AV_{RH}$	—	—	—	$AV_{CC}$	V		
Supply current	Conversion in operation	$I_A$	$AV_{CC}$	$AV_{CC} = 3.3\text{ V}$	—	3.0	5.0	mA	
	Conversion stopped	$I_{AH}$			—	—	5.0	μA	
Reference voltage supply current	Conversion in operation	$I_R$	$AV_{RH}$	$AV_{CC} = 3.3\text{ V}$ , $AV_{RH} = 3.3\text{ V}$	—	2.0	3.0	mA	
	Conversion stopped	$I_{RH}$			—	—	10	μA	
Interchannel variation	—	AN0 to AN7	—	—	—	4	LSB		

Notes :

- The smaller the |AVRH| is, the greater the error is in general.
- The external circuit output impedance of analog input should be used in compliance with the following requirements :

External circuit output impedance ≤ 2 (kΩ)

If the output impedance of the external circuit is too high, an analog voltage sampling duration shortage might occur. (Sampling duration = 1.4 μs : @33 MHz)

# MB91F155/MB91154

## • A/D Converter Glossary

- Resolution : Analog changes that are identifiable by the A/D converter.
- Linearity error : The deviation of the straight line connecting the zero transition point (00 0000 0000  $\leftrightarrow$  00 0000 0001) with the full-scale transition point (11 1111 1110  $\leftrightarrow$  11 1111 1111) from actual conversion characteristics.
- Differential linearity error : The deviation of input voltage needed to change the output code by one LSB from the theoretical value.
- Total error : The difference between actual and theoretical conversion values including a zero transition/full-scale transition/linearity error.

$$1 \text{ LSB (theoretical value)} = \frac{AV_{RH} - AV_{SS}}{1024} \quad [V]$$

$$V_{OT} \text{ (theoretical value)} = AV_{SS} + 0.5 \text{ LSB} \quad [V]$$

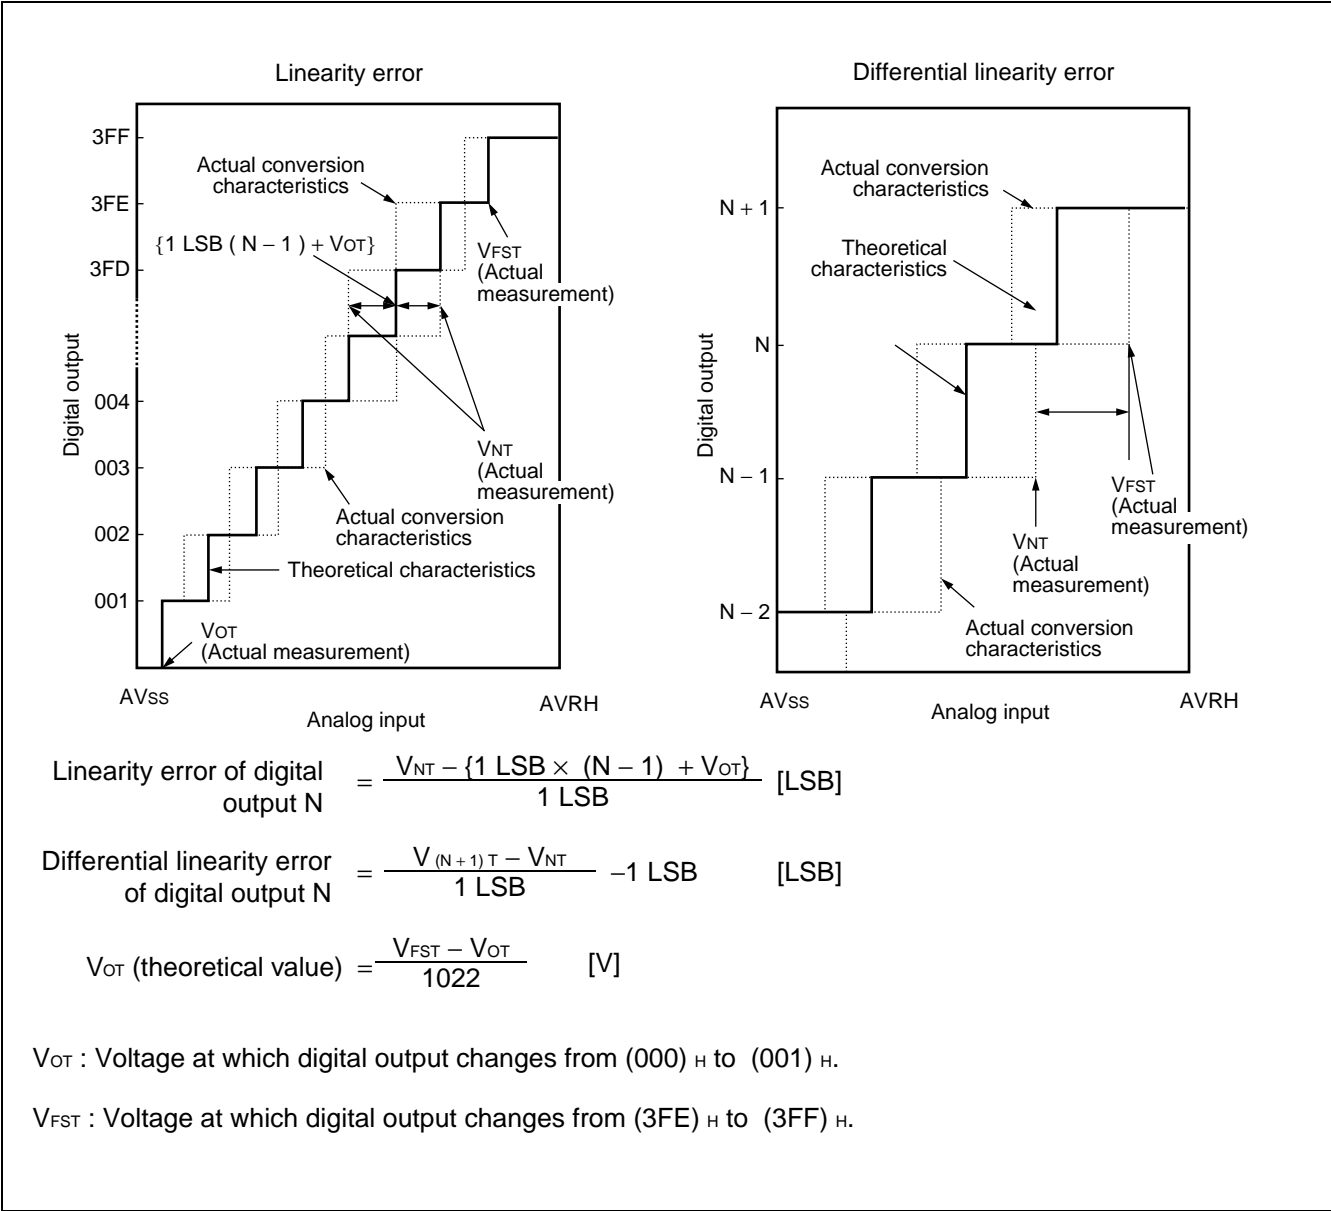

$$V_{FST} \text{ (theoretical value)} = AV_{RH} - 1.5 \text{ LSB} \quad [V]$$

$$\text{Total error of digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}}$$

V<sub>NT</sub> : Voltage at which digital output changes from (N + 1) to N.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

The contents of this document may not be reproduced or copied without the permission of FUJITSU LIMITED.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipments, industrial, communications, and measurement equipments, personal or household devices, etc.).

#### **CAUTION:**

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have inherently a certain rate of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Control Law of Japan, the prior authorization by Japanese government should be required for export of those products from Japan.
