Low-Voltage CMOS Octal Buffer Flow Through Pinout

With 5 V-Tolerant Inputs and Outputs (3-State, Non-Inverting)

The MC74LCX541 is a high performance, non-inverting octal buffer operating from a 2.3 to 3.6 V supply. This device is similar in function to the MC74LCX244, while providing flow through architecture. High impedance TTL compatible inputs significantly reduce current loading to input drivers while TTL compatible outputs offer improved switching noise performance. A V_I specification of 5.5 V allows MC74LCX541 inputs to be safely driven from 5 V devices. The MC74LCX541 is suitable for memory address driving and all TTL level bus oriented transceiver applications.

Current drive capability is 24 mA at the outputs. The Output Enable ($\overline{OE1}$, $\overline{OE2}$) inputs, when HIGH, disables the output by placing them in a HIGH Z condition.

Maximum ratings are those values beyond which device damage can occur. Maximum ratings applied to the device are individual stress limit values (not normal operating conditions) and are not valid simultaneously. If these limits are exceeded, device functional operation is not implied, damage may occur and reliability may be affected.

1. Output in HIGH or LOW State. I_O absolute maximum rating must be observed.
