

MIC1832

μP Supervisory Circuit

General Description

The MIC1832 is a multifunction circuit which monitors microprocessor activity, external reset and power supplies in microprocessor based systems. The circuit functions include a watchdog time, power supply monitor, microprocessor reset, and manual pushbutton reset input.

The power supply line is monitored with a comparator and an internal voltage reference. /RST is forced low when an out-of-tolerance condition exists and remains asserted for at least 250ms after V_{CC} rises above the threshold voltage (2.55V or 2.88V). The /RST pin will remain logic low with V_{CC} as low as 1.4V.

The Watchdog input (/ST) monitors μP activity and will assert /RST if no μP activity has occurred with in the watchdog timeout period. The watchdog timeout period is selectable with nominal period of 150, 600, 1200 milliseconds.

Features

- · Power OK/Resettime delay, 250ms min.
- · Watchdog timer, 150ms, 600ms, or 1.2s typical
- Precision supply voltage monitor, select between 5% or 10% of supply voltage
- Avaiable in 8-pin surface mount (SO)
- · Debounced External reset input
- Low supply current, <18μA typical

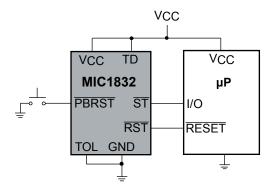

Applications

- · Autimotive systems
- · Intelligent systems
- · Critical microprocessor power monitoring
- · Battery powered computers
- Controllers

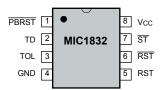

Ordering Information

Part Number		Tomporatura Banga	Dookogo	
Standard	Pb-Free	Temperature Range	Package	
MIC1832N	MIC1832NY	–40°C to +85°C	8-Pin PDIP	
MIC1832M	MIC1832MY	–40°C to +85°C	8-Pin SOIC	

Typical Application

Pin Configuration

8-Pin PDIP Package 8-Pin SOIC Package

Pin Description

Pin Number	Pin Name	Pin Function
1	/PBRST	Pushbutton Reset Input: This input is debounced and can be driven with external logic signals or by means of a mechanical pushbutton to actively force a reset. All pulses less than 1ms in duration on the /PBRST pin are ignored, whereas, any pulse with a duration of 20ms or greater is guaranteed to cause a reset.
2	TD	Time Delay input: This input selects the timebase used by the watchdog timer. When TD = 0V, the watchdog timeout period is set to a normal value of 150ms, when TD = open, the watchdog timeout period is et to a nominal value of 600ms and when TD = V _{CC} , the watchdog period is 1.2s nominally.
3	TOL	Tolerance Select Input: Selects whether 5% or 10% of VCC is used as the reset threshold voltage. When TOL = 0V, the 5% tolerance level is selected and when TOL = V_{CC} , a 10% tolerance level is selected.
4	GND	IC ground pin, 0V reference
5	RST	RST is asserted high if either V_{CC} goes below the reset threshold, the watchdog times out or /PBRST is pulled low for a minimum of 20ms. RST remains asserted for one reset timeout period after VCC exceeds the reset threshold or after the watch times out or after /PBRST goes high.
6	/RST	/RST is asserted low if either V_{CC} goes below the reset threshold, the watchdog times out or /PBRST is pulled low for a minimum of 20ms. /RST remains asserted for one reset timeout period after V_{CC} exceeds the reset threshold or after the watch times out or after /PBRST goes high. Open-drain output
7	/ST	Input to watchdog timer. If /ST does not see a transition from high to low within the watchdog timeout period, RST and /RST will be asserted.
8	V _{CC}	Primary supply input, +5V

Absolute Maximum Ratings (Note 1)

Operating Ratings (Note 2)

Operating Temperature Range	
MIC1832M/N	40°C to 85°C
MIC1832D	40°C to 85°C
Power Dissapation	700mW

Electrical Characteristics

 V_{IN} = xx; R_L = xx; T_A = Operating Temperature Range, **bold** values indicate -40°C ≤ T_A ≤ +85°C; unless noted

Parameter	Condition	Min	Тур	Max	Units
Supply Voltage Range	V _{CC}			5.5	V
Supply Current	I _{CC} @ V _{CC} = 5V (Note 4)		18	30	μA
	I _{CC} @ V _{CC} = 3.3V (Note 4)		15	25	μΑ
/ST and /PBRST Input Levels	V _{IH} (Note 5)	2		V _{CC} +0.3	V
	V _{IH} (Note 6)	V _{CC} -0.4		V _{CC} +0.3	V
	V _{IL}	-0.3	4 V _{CC} +0.3 0.5 ±1 0.4	V	
Input Leakage, /ST (Note 7)	I _{IL}			±1	μA
Output Voltage, /RST, RST	I _{SOURCE} = 350μA, V _{CC} = 3.3V	2.4			V
Output Voltage, /RST, RST	I _{SINK} = 10mA, V _{CC} = 3.3V			0.4	V
Output Voltage	V_{CC} = 1.4V, I_{SINK} = 50 μ A			0.3	V
V _{CC} 5% Trip Point (Reset Threshold Voltage)	TOL = Gnd	2.8	2.88	2.97	V
V _{CC} 10% Trip Point (Reset Threshold Voltage)	TOL = V _{CC}	2.47	2.55	2.64	V
Input Capacitance, /ST, TOL	C _{IN} (Note 8)			5	pF
Output Capacitance, /RST, RST	C _{OUT} (Note 8)			7	pF

AC Electrical Characteristics

 V_{CC} = 4.5V to 5.5V; T_A = Operating Temperature Range, **bold** values indicate –40°C ≤ T_A ≤ +85°C; unless noted

/PBRST Min. Pulse Width, t _{PB}	/PBRST = V _{II} (Note 9)	20			ms
/PBRST Delay, t _{PBD}		1	4	20	ms
Reset Active Time, t _{RST}		250	610	1000	ms
/ST Pulse Width, t _{ST}		20			ms
/ST Timeout Period, t _{TD}	TD = 0V	62.5	150	250	ms
	TD = Open	250	250 600 1	1000	ms
	TD = V _{CC}	500	1200		ms
V _{CC} Fall Time, t _F		40			μs
V _{CC} Rise Time, t _R		0			ns
V _{CC} Detect to /RST Low and RST High, t _{RPD}	V _{CC} Falling (Note 10)		5	8	μs
V _{CC} Detect to /RST Low and RST Low, t _{RPD}	V _{CC} Falling (Note 9)	250	610	1000	μs

- **Note 1.** Exceeding the absolute maximum rating may damage the device.
- Note 2. The device is not guaranteed to function outside its operating rating.
- Note 3. Devices are ESD sensitive. Handling precautions recommended. Human body model, 1.5k in series with 100pF.
- $\textbf{Note 4.} \quad I_{CC} \text{ is measured with /PBRST and all outputs open and inputs within 0.5V of supply rails}$
- **Note 5.** Measured with $V_{CC} \ge 2.7V$
- **Note 6.** Measured with $V_{CC} < 2.7V$
- Note 7. /PBRST has an internal pull-up resistor to V_{CC} (typ. $40k\Omega)$
- **Note 8.** Guaranteed by design at $T_A = 25^{\circ}C$
- Note 9. /PBRST must be held low for a minimum of 20ms to guarantee a reset
- Note 10. V_{CC} falling a 8.5mV/ μ s

Applications Information

Power Monitor

The /RST and RST pins are asserted whenever $\rm V_{CC}$ falls below the reset threshold voltage as determined by the TOL pin. A 5% tolerance level (4.62V reset threshold voltage) can be selected by connecting the TOL pin to ground and a 10% tolerance can be selected by connecting the TOL pin to $\rm V_{CC}$. The reset pins will remain asserted for a period of 250ms after $\rm V_{CC}$ has risen above the reset threshold voltage. The reset function ensures the microprocessor is properly reset and powers up into a known condition after a power failure. /RST will remain valid with $\rm V_{CC}$ as low as 1.4V.

Watchdog Timer

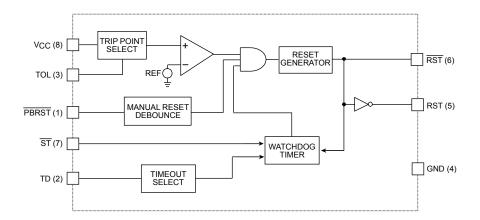

The microprocessor can be mounted by connecting the /ST pin (watchdog input) to a bus line or I/O line. If a high-to-low does not occur on the/ST pin within the watchdog timeout

period (determined by the TD pin, see Table 1.), the /RST and the RST will remain asserted for 250ms when this occurs. A minimum pulse of 75ns or any transition high-to-low on the /ST pin will reset the watchdog timer. The watchdog timer will be reset if /ST sees a valid transition within the watchdog timeout period.

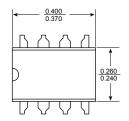

Pushbutton Reset Input

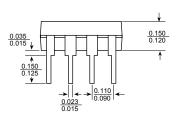

The /PBRST input can be driven with a manual pushbutton switch or with external logic signals. the input is internally debounced and requires an active low signal to force the reset outputs into their active states. The /PBRST input will recognize any pulse that is 20ms in duration or greater and will ignore all pulses that are less than 1ms in duration.
