## NJM2294

## FM IF IC FOR PAGER

#### GENERAL DESCRIPTION

NJM2294 is a super low current FM IF IC for pagers. It includes almost all functions of the paging IF system. In those functions, the RSSI function can be used for automatic gain control. When the electric field strength is high, the RSSI output signal can control the attenuation of an RF amplifier to improve the received condition.

#### FEATURES

JRC

- Super low Operating Current  $(600 \,\mu\,\text{A})$
- Low Operating Voltage (1.1~4.0V)
- RSSI (Received Signal Strength Indicator)
- FSK wave shaper
- Battery check alarm function (Alarm Voltage=1.1V typ.)
- Battery saving function
- A high output current voltage regurator with an external transistor (1.1V typ.)

V+

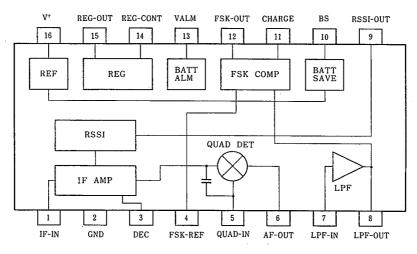

- A ceramic discriminator is available.Package Outline SSOP16
- Package OutlineBipolar Technology

#### RECOMMENDED OPERATIONAL CONDITION

#### FSK WAVE SHAPING FUNCTION

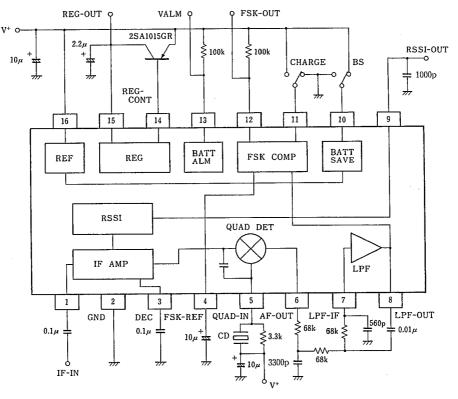

When the demodulated FSK signal is weak or noisy, the micro computer may fail to read data. The wave shaping circuit (comparator) will change those signals to the correct logical signal to prevent the readerror.

### QUICK CHARGE/DISCHARGE FUNCTION

The DC voltage of the FSK-REF terminal is equal to that of the demodulated FSK signal. When the battery saving state turns into the ordinary state, the FSK-REF terminal voltage will be late to come up to the reference voltage by the time constant of an external capacitor and an internal resistor, and the wave shaped data may be failed. This circuit will charge/discharge the external capacitor quickly to prevent the error.

When the DC level of the FM demudulated output changes in the operation mode of this function, the FSK-REF terminal voltage follows to the FSK demodulated output DC voltage, and the FSK output duty ratio can be constant.
