#### DESCRIPTION

The P4C116 is a 16,384-bit ultra high-speed static RAMs organized as 2K x 8. The CMOS memories require no clocks or refreshing and have equal access and cycle times. Inputs are fully TTL-compatible. The RAMs operate from a single 5V±10% tolerance power supply. Current drain is typically 10 µA from a 2.0V supply.

Access times as fast as 10 nanoseconds are available,

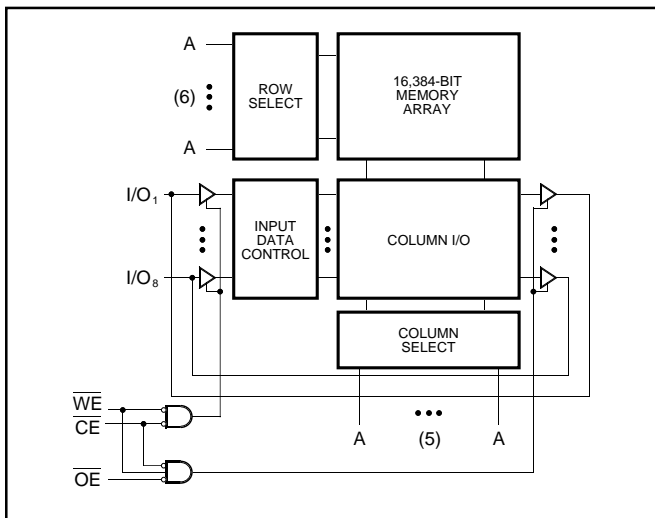

permitting greatly enhanced system operating speeds. CMOS is used to reduce power consumption to a low 633 mW active, 193 mW standby.

The P4C116 is available in 24-pin 300 mil DIP, SOJ and SOIC packages providing excellent board level densities.

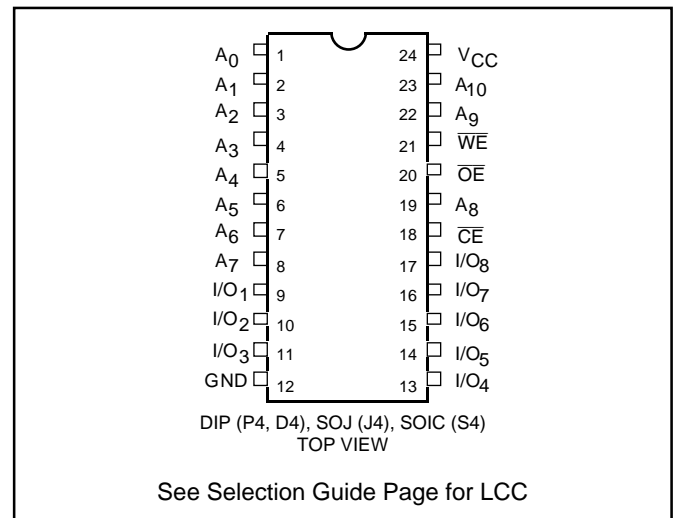

The P4C116 is also available in 24-pin rectangular and 28-pin square LCC packages.

**Notes:**

1. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to MAXIMUM rating conditions for extended periods may affect reliability.
2. Extended temperature operation guaranteed with 400 linear feet per minute of air flow.
3. Transient inputs with V<sub>IL</sub> and I<sub>IL</sub> not more negative than -3.0V and -100mA, respectively, are permissible for pulse widths up to 20ns.
4. This parameter is sampled and not 100% tested.
5.  $\overline{WE}$  is HIGH for READ cycle.
6.  $\overline{CE}$  is LOW and  $\overline{OE}$  is LOW for READ cycle.
7. ADDRESS must be valid prior to, or coincident with  $\overline{CE}$  transition LOW.
8. Transition is measured ± 200 mV from steady state voltage prior to change, with loading as specified in Figure 1. This parameter is sampled and not 100% tested.
9. Read Cycle Time is measured from the last valid address to the first transitioning address.

### Note:

Because of the ultra-high speed of the P4C116/L, care must be taken when testing this device; an inadequate setup can cause a normal functioning part to be rejected as faulty. Long high-inductance leads that cause supply bounce must be avoided by bringing the  $V_{CC}$  and ground planes directly up to the contactor fingers. A 0.01  $\mu$ F high frequency

capacitor is also required between  $V_{CC}$  and ground. To avoid signal reflections, proper termination must be used; for example, a 50 $\Omega$  test environment should be terminated into a 50 $\Omega$  load with 1.73V (Thevenin Voltage) at the comparator input, and a 116 $\Omega$  resistor must be used in series with  $D_{OUT}$  to match 166 $\Omega$  (Thevenin Resistance).
