## Description

Pericom's Semiconductor's PI5C6800 is a 10-bit bus switch with low On-State resistance. The bus switch creates no additional propagation delay.
The switch is turned on by a single enable ( $\overline{\mathrm{ON}})$ input. When $\overline{\mathrm{ON}}$ is LOW, the switch is on and port A is connnected to port B . When $\overline{\mathrm{ON}}$ is HIGH , the switch between port A and port B is open and the B port is precharged to BIASV through the equivalent of a $10-\mathrm{k} \Omega$ resistor.

## Notes:

1. Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
2. The input and output negative-voltage ratings may be exceeded if the input and output clamp-current ratings are observed.
3. The maximum package power dissipation is calculated using a junction temperatue of $150^{\circ} \mathrm{C}$ and a board trace length of 750 mils.

## Notes:

1. Measured by the voltage drop between the $A$ and $B$ terminals at the indicated current through the switch. On-State resistance is determined by the lower of the voltages of the two (A or B) terminals.
2. This is the increase in supply current for control input.
3. All typical values are at $\mathrm{V}_{\mathrm{CC}}=5 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$.

Notes:

1. This parameter is warranted but not production tested. The propagation delay is based on the RC time constant of the typical On-State resistance of the switch and a load capacitance of 50 pF , when driven by an ideal voltage source (zero output impedance).

## Parameter Measurements

## Notes:

1. $\mathrm{C}_{\mathrm{L}}$ includes probe and jig capacitance.
2. Waveform 1 is for an output with internal conditions such that the output is LOW except when disabled by the output control.

Waveform 2 is for an output with internal conditions such that the output is HIGH except when disabled by the output control.
3. All input pulses are supplied by generators having the following characteristics: $\mathrm{PRR}<10 \mathrm{MHz}, \mathrm{Z}_{\mathrm{O}}=50 \Omega, \mathrm{t}_{\mathrm{r}} \leq 2.5 \mathrm{~ns}, \mathrm{t}_{\mathrm{f}} \leq 2.5 \mathrm{~ns}$.
4. The outputs are measured one at a time with one transition per measurement.
5. $t_{P L Z}$ and $t_{\text {PHZ }}$ are the same as $\mathrm{t}_{\text {dis }}$.
6. $t_{\text {PZL }}$ and tPZH are the same as $\mathrm{t}_{\text {en }}$.
7. $t_{\text {PLH }}$ and $t_{\text {PHL }}$ are the same as $\mathrm{t}_{\mathrm{pd}}$.

## Applications Information

## Logic Inputs

The logic control inputs can be driven up to +5.5 V regardless of the supply voltage. For example, given a +5.0 V supply, IN may be driven low to 0 V and high to 5.5 V . Driving IN Rail-to-Rail® minimizes power consumption.

## Power-Supply Sequencing

Proper power-supply sequencing is recommended for all CMOS devices. Always apply $\mathrm{V}_{\mathrm{CC}}$ before applying signals to the input/ output or control pins.
