

PNX8526

Programmable source decoder with integrated peripherals

Rev. 01 – 6 October 2003

Preliminary data

1. General description

The PNX8526 is a highly integrated media processor for use in Advanced Set Top Boxes (ASTB) and Digital Television (DTV) systems. The PNX8526 is targeted at the mid to high-end ASTB/DTV systems, decoding “all format” HD and SD MPEG2 source material with Standard Definition (SD), or double line-rate SD display capabilities. Although the PNX8526 can process high level input formats, its display capabilities are primarily targeted at NTSC, PAL and SECAM televisions. It is also intended for lower cost DTVs, those not considered high definition. Progressive output is also available for double line-rate television displays, or for high resolution graphic content to be displayed on a computer monitor. The PNX8526 is designed in a high performance 0.12-micron process.

The PNX8526 performs source decode functions, including - conditional access, MPEG2 transport stream de-mux, MPEG2 video decode, audio decode and processing, graphics generation, video processing, and image composition and display. A 32-bit 200 MHz VLIW processor, referred to as the TriMedia™ 3200 CPU core (TM32 CPU), carries out the majority of media processing operations performed by the PNX8526. Fixed function hardware will perform some operations that are not handled by the TM32 CPU. Additionally, the PNX8526 supports a number of peripheral interfaces such as I²C, USB, IDE and UART. Other interfaces such as IEEE-1284 and Ethernet may be supported via Super I/O devices that reside on a PCI expansion bus. The expansion bus also provides for glueless interface to 8-bit wide slave devices, such as Flash/ROM, DOCSIS modem, UARTs, etc.

An embedded MIPS processor (PR3940) running at 150 MHz is intended to run the OS. (There is no direct support for an external processor; however, a CPU of any type may be connected to the PNX8526 via the PCI interface.) This implies a complete CPU subsystem consisting of the CPU itself, local memory, and an interface to PCI. The MIPS processor is primarily responsible for control functions and graphics-intensive operating systems, while the TM32 CPU is responsible for running all real-time media processing functions. All resources supported within the PNX8526 are accessible by both the MIPS processor and the TM32 CPU. The software documentation of the PNX8526 provides more details on the interaction between the MIPS and the TM32 CPU.

The PNX8526 is intended to be used with a small companion IC, the PNX8510. This analog companion chip provides the majority of analog video and audio support for the output of the PNX8526. The PNX8510 companion is capable of simultaneously driving two video channels (6 DACs) and two stereo audio channels (4 DACs).

PHILIPS

2. Features

- 200 MHz, 5 instruction/clock cycle 32-bit VLIW processing core (TM32 CPU)
- 150 MHz, MIPS PR3940 processing core
- External CPU support via PCI
- Support for multiple digital video (D1) input streams
- Support for multiple MPEG2 or DIRECTV transport streams (parallel format)
- On-chip conditional access for DVB, DES, MULTI2, CAM, DIRECTV
- On-chip copy protection support for OpenCable™ and ATSC (NRSS-B)
- Simultaneous decode of two SD streams (MPEG2) or one HD MPEG Stream (AFD style HD-SD decode)
- Simultaneous decode of two AC-3 or equivalent audio streams
- High performance 2D rendering and DMA capability
- Dual image composition/screen refresh engines: four layer primary output, two layer secondary output
- Multiple channel output to support watch/record and multi-room modes
- Embedded 1394 link layer with 5C copy protection
- Soft modem support via SSI interface
- 16, 32, and 64 MB Unified Memory Architecture implemented with high speed SDRAM (166 MHz)
- System expansion capability via industry standard PCI bus
- Core peripherals (I²C, UART, USB, etc.) on the chip, other peripherals supported via third-party SuperIO chip

3. Applications

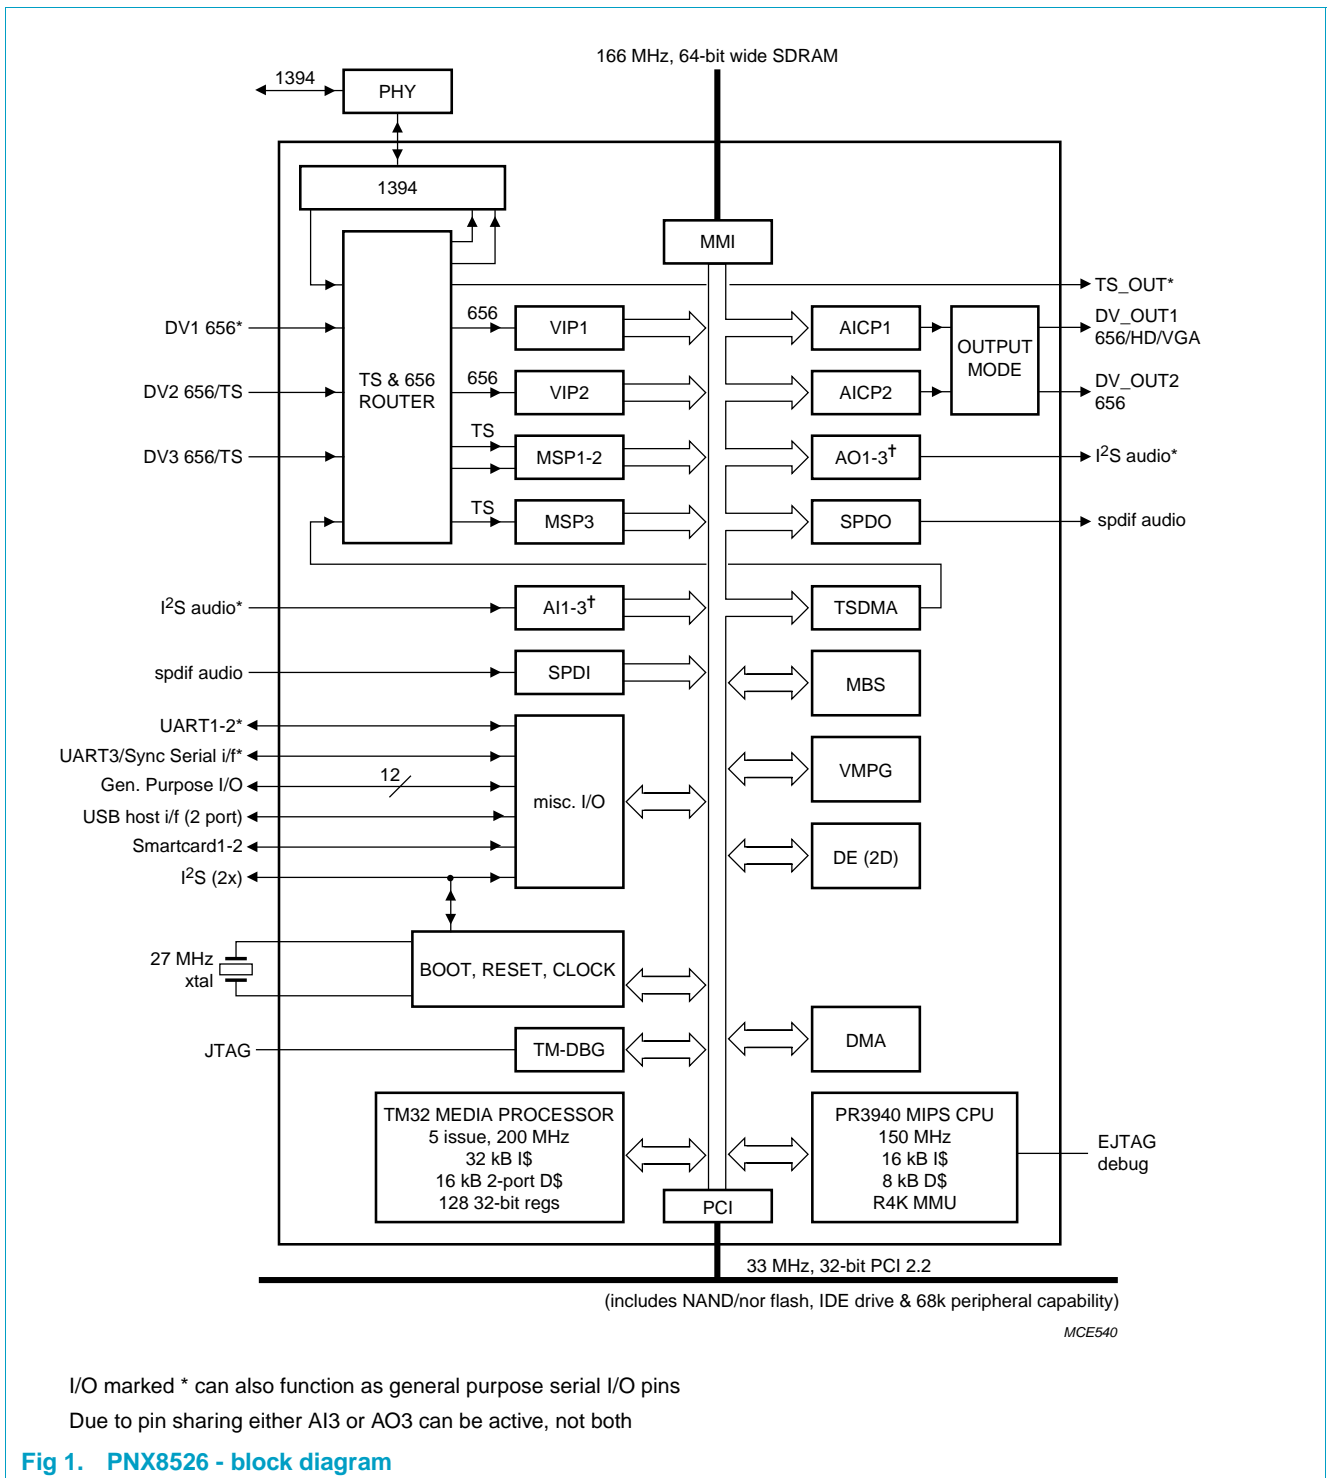

- Advanced Set Top Box (ASTB)
- Digital Television (DTV)

4. Ordering information

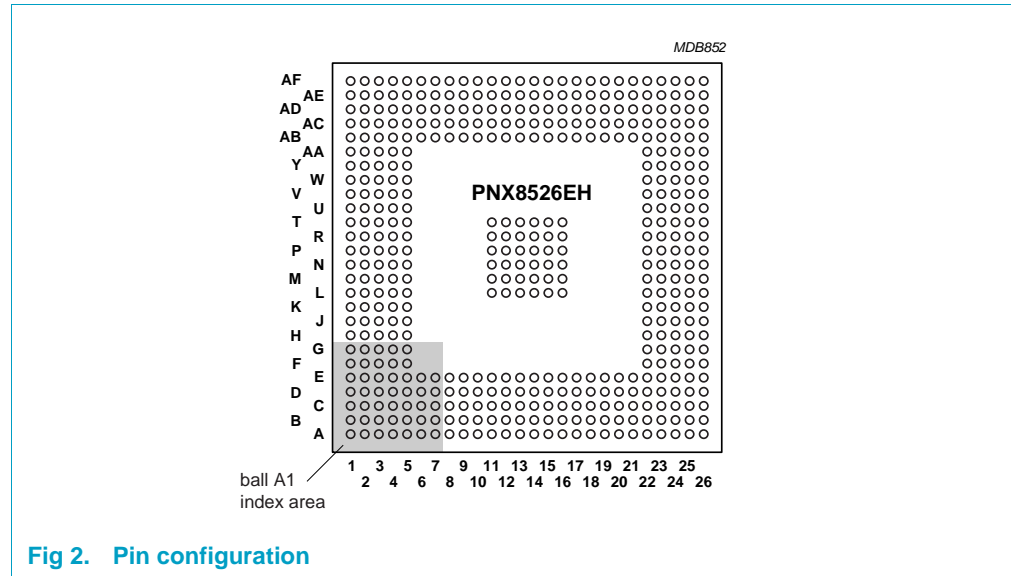

Table 1: Ordering Information

Type number	Package Name	Description	Version
PNX8526EH	HBGA456	Plastic thermal enhanced ball grid array package; 456 balls; body 35 x 35 x 1.8 mm; heatsink	SOT610-1

5. Block diagram

6. Pinning information

6.1 Pinning

In the tables that follow the PNX8526 signals have been sorted by functional group. For quick reference, [Table 2](#) identifies each functional group and gives table location.

Table 2: Signal groups

Functional Group	Group Name	Table/Page Number
PCI	Peripheral Controller Interface	Table 3 on page 5
MISC	Miscellaneous System Interface	Table 4 on page 7
MMI	Main Memory Interface	Table 5 on page 7
GPIO	General Purpose Input/Output	Table 6 on page 9
COM	Serial Communication	Table 7 on page 10
USB	Universal Serial Bus	Table 8 on page 10
1394	IEEE 1394 Port	Table 9 on page 11
I ² C-bus	Serial Communications Port	Table 10 on page 11
AVIF	Audio and Video Interface	Table 11 on page 11
DVB	Digital Video Bus	Table 12 on page 13
PLL	Phase Lock Loop	Table 13 on page 14
PWR	Analog Power and Ground / Digital Power and Ground Connections	Table 14 on page 14
TEST	Test Contacts	Table 15 on page 17
All pins	Pin Descriptions in alpha/numeric order	Table 16 on page 18

6.2 Pin description

All pad inputs and I/O have built-in pull-ups (~80 kΩ) and Schmitt trigger input thresholds. (See [Table 19](#) for maximum ratings).

The following pins do not have pull-ups:

XTALI, PC1x, analog pins, I²C, Main Memory Interface, USB_DPx and USB_DMx.

The following pins do not have Schmitt trigger inputs:

XTALI, analog pins, USB_DPx and USB_DMx.

Table 3: Peripheral Controller Interface (PCI)

indicates multiplexed signal, see [Section 6.2.1](#) for more details.

Symbol	Pin	Type	Description	Alternate Function

AD[02]	AE12	I/O	Multiplexed Address or Data Bit 2	
AD[01]	AD12	I/O	Multiplexed Address or Data Bit 1	
AD[00]	AC12	I/O	Multiplexed Address or Data Bit 0	
C/BE[3]	AD1	I/O	Multiplexed Command or Byte Enable 3	
C/BE[2]	AF5	I/O	Multiplexed Command or Byte Enable 2	

Table 3: Peripheral Controller Interface (PCI)...*continued*# indicates multiplexed signal, see [Section 6.2.1](#) for more details.

Symbol	Pin	Type	Description	Alternate Function
C/ $\overline{\text{BE}}[1]$	AE8	I/O	Multiplexed Command or Byte Enable 1	
C/ $\overline{\text{BE}}[0]$	AD10	I/O	Multiplexed Command or Byte Enable 0	
CLK	AA1	I	PCI Bus Clock	
DEVSEL	AF7	I/O	Device Select is asserted when a target address is decoded and remains asserted to indicate that a target device is selected.	
FRAME	AF6	I/O	Frame is asserted to indicate start of bus transaction and remains asserted until final data phase begins.	
GNT	Y3	I/O	Arbitration Grant is asserted to indicate access to the bus has been granted. This pin is an input when an external arbiter is used and an output when using the internal arbiter.	
GNT_A	Y4	I/O	Auxiliary Arbitration Grant_A is asserted to indicate bus access has been granted to an external PCI master. Used where internal arbiter is configured.	#
GNT_B	AA4	I/O	Auxiliary Arbitration Grant_B is asserted to indicate bus access has been granted to an external PCI master. Used where internal arbiter is configured.	#
IDSEL	AF3	I/O	Initialization Device Select provides chip select during configuration read and write transactions.	
INTA	V4	I/O	Interrupt A is asserted to request an interrupt. This pin may be configured as an input if the internal PIC is used, or as an output if the external interrupt controller is used. Polarity in active low.	
IRDY	AE6	I/O	Initiator Ready is asserted during writes to indicate valid data on AD[31:0]. Also asserted during reads to indicate the target is prepared to accept data. Wait states are inserted until IRDY and TRDY are both asserted.	
PAR	AF8	I/O	Parity supports even parity across the PCI Address/Data Bus AD[31:0] and Command/Byte Enable Bus (C/ $\overline{\text{BE}}[3:0]$). The Bus Master drives PAR for address and write data phases. The Target drives PAR for the read data phases.	
PERR	AD7	I/O	Parity Error indicates data parity errors during all PCI transactions except Special Cycle.	
REQ	Y2	I/O	Arbitration Request on PCI Bus. Request is an output when using an external arbiter and an input when using an internal arbiter.	
REQ_A	AA2	I/O	Auxiliary Arbitration REQ_A on PCI Bus. Used in modes where internal arbiter is configured.	#
REQ_B	AA3	I/O	Auxiliary Arbitration REQ_B on PCI Bus. Used in modes where internal arbiter is configured.	#
RESET_IN	W3	I	PCI Bus Global Reset	
SERR	AC7	I/O	System Error	
STOP	AE7	I/O	Stop is asserted to indicate a request from the target for the master to stop the current transmission.	
TRDY	AD6	I/O	Target Ready is asserted during reads to indicate valid data on AD[31:0]. It is asserted during writes to indicate the target is prepared to accept data. Wait states are inserted until IRDY and TRDY are both asserted.

USB_DM[1]	D7	I/O	Data Minus Bit 1
USB_PWR	W1	O	USB port power On/Off 0 = Power on 1 = Power off
USB_OVRCUR	W2	I	Indicates over current being drawn by a USB device 0 = Over current detected 1 = No over current

Table 9: IEEE 1394 port

Symbol	Pin	Type	Description
PHY_D[7]	B9	I/O	PHY Data Bit 7. Data is expected on pins 7:0 for 400 MB packets.
PHY_D[6]	D10	I/O	PHY Data Bit 6. Data is expected on pins 7:0 for 400 MB packets.
PHY_D[5]	C9	I/O	PHY Data Bit 5. Data is expected on pins 7:0 for 400 MB packets.
PHY_D[4]	A8	I/O	PHY Data Bit 4. Data is expected on pins 7:0 for 400 MB packets.
PHY_D[3]	B8	I/O	PHY Data Bit 3. Data is expected on pins 3:0 for 200 MB packets.
PHY_D[2]	D9	I/O	PHY Data Bit 2. Data is expected on pins 3:0 for 200 MB packets.
PHY_D[1]	C8	I/O	PHY Data Bit 1. Data is expected on pins 1:0 for 100 MB packets.
PHY_D[0]	A7	I/O	PHY Data Bit 0. Data is expected on pins 1:0 for 100 MB packets.
PHY_CTL[1]	B7	I/O	PHY Control Bit 1. Indicates the mode for data on the Din port.
PHY_CTL[0]	C7	I/O	PHY Control Bit 0. Indicates the mode for data on the Din port.
PHY_LREQ	B5	O	Used by the link to make bus requests and to access PHY registers. This is a serial bus. A train of pulses is sent on this signal.
PHY_ISO_N	A6	I	Signals which type of isolation mode is used at the PHY-Link interface. 0 = This is 1394-1995 Annex J type isolation. Enables differentiator circuitry. 1 = Direct connection or single capacitor isolation mode. This will disable the differentiator circuitry.
CLK_L1394	D8	I	System clock. 49.152 MHz input

Table 10: Serial communication port (I²C)

Symbol	Pin	Type	Description
I2C1_SCL	D6	I/O	Serial Communications Port (I ² C-bus) Clock
I2C1_SDA	A4	I/O	Serial Communications Port (I ² C-bus) Data
I2C2_SCL	H1	I/O	Serial Communications Port (I ² C-bus) Clock
I2C2_SDA	K4	I/O	Serial Communications Port (I ² C-bus) Data

Table 11: Audio and video interface

indicates multiplexed signal, see [Section 6.2.1](#) for more details.

Symbol	Pin	Type	Description	Alternate Function
DV_OUT1[9]	M2	O	Digital Video Output1, Bit 9 for primary display channel from AICP	
DV_OUT1[8]	M1	O	Digital Video Output1, Bit 8 for primary display channel from AICP	
DV_OUT1[7]	N4	O	Digital Video Output1, Bit 7 for primary display channel from AICP	
DV_OUT1[6]	N3	O	Digital Video Output1, Bit 6 for primary display channel from AICP	
DV_OUT1[5]	N1	O	Digital Video Output1, Bit 5 for primary display channel from AICP	
DV_OUT1[4]	N2	O	Digital Video Output1, Bit 4 for primary display channel from AICP	
DV_OUT1[3]	P2	O	Digital Video Output1, Bit 3 for primary display channel from AICP	
DV_OUT1[2]	P1	O	Digital Video Output1, Bit 2 for primary display channel from AICP	
DV_OUT1[1]	P4	O	Digital Video Output1, Bit 1 for primary display channel from AICP	
DV_OUT1[0]	P3	O	Digital Video Output1, Bit 0 for primary display channel from AICP	
DV_OUT2[9]	R2	O	Digital Video Output2, Bit 9 for secondary display channel from AICP	
DV_OUT2[8]	R4	O	Digital Video Output2, Bit 8 for secondary display channel from AICP	
DV_OUT2[7]	R3	O	Digital Video Output2, Bit 7 for secondary display channel from AICP

DV2_DATA[2]	AD23	DVB	I	Digital Video Transport Stream2 Data Bit 2
DV2_SOP	AD24	DVB	I	Digital Video Transport Stream2 Start of Packet
DV2_VALID	AD25	DVB	I	Digital Video Transport Stream2 Data Valid
DV2_ERR	AD26	DVB	I	Digital Video Transport Stream2 Error
V _{SS}	AE1	PWR	-	System Ground
V _{SS}	AE2	PWR	-	System Ground
AD[23]	AE3	PCI	I/O	Multiplexed Address or Data Bit 23
AD[21]	AE4	PCI	I/O	Multiplexed Address or Data Bit 21
AD[19]	AE5	PCI	I/O	Multiplexed Address or Data Bit 19
IRDY	AE6	PCI	I/O	Initiator Ready is asserted during writes to indicate valid data on AD[31:0]. Also asserted during reads to indicate the target is prepared to accept data. Wait states are inserted until IRDY and TRDY are both asserted.
STOP	AE7	PCI	I/O	Stop is asserted to indicate a request from the target for the master to stop the current transmission.
C/BE[1]	AE8	PCI	I/O	Multiplexed Command or Byte Enable 1
AD[12]	AE9	PCI	I/O	Multiplexed Address or Data Bit 12
AD[08]	AE10	PCI	I/O	Multiplexed Address or Data Bit 8
AD[05]	AE11	PCI	I/O	Multiplexed Address or Data Bit 5
AD[02]	AE12	PCI	I/O	Multiplexed Address or Data Bit 2
XIO_A25	AE13	MISC	I/O	XIO Address Bit 25
GPIO[7]	AE14	GPIO	I/O	General Purpose Input/Output Bit 7

Table 16: All pins...continued

Symbol	Pin	Group	Type	Description
I2S_IO_SCK	AE15	AVIF	I/O	Audio IN/OUT Serial Clock
I2S_IO_SD[1]	AE16	AVIF	I/O	Audio IN/OUT Data Bit 1
DV1_DATA[9]	AE17	DVB	I/O	ITU-656 VIP Data Bit 9 (Most Significant Bit)
DV1_DATA[5]	AE18	DVB	I/O	ITU-656 VIP Data Bit 5
DV1_DATA[2]	AE19	DVB	I/O	ITU-656 VIP Data Bit 2
DV1_CLK	AE20	DVB	I/O	ITU-656 VIP Data Clock

I2S_IN2_SD	AE22	AVIF	I	Audio IN2 Data
DV2_DATA[4]	AE23	DVB	I	Digital Video Transport Stream2 Data Bit 4
DV2_DATA[1]	AE24	DVB	I	Digital Video Transport Stream2 Data Bit 1
V _{SS}	AE25	PWR	-	System Ground
V _{SS}	AE26	PWR	-	System Ground
V _{SS}	AF1	PWR	-	System Ground
V _{SS}	AF2	PWR	-	System Ground
IDSEL	AF3	PCI	I/O	Initialization Device Select provides chip select during configuration read and write transactions.
AD[22]	AF4	PCI	I/O	Multiplexed Address or Data Bit 22
C/ $\overline{\text{BE}}$ [2]	AF5	PCI	I/O	Multiplexed Command or Byte Enable 2
FRAME	AF6	PCI	I/O	Frame is asserted to indicate start of bus transaction and remains asserted until final data phase begins.
DEVSEL	AF7	PCI	I/O	Device Select is asserted when a target address is decoded and remains asserted to indicate that a target device is selected.
PAR	AF8	PCI	I/O	Parity supports even parity across the PCI Address/Data Bus AD[31:0]) and Command/ Byte Enable Bus (C/ $\overline{\text{BE}}$ [3:0]). Bus Master drives PAR for address and write data phases. Target drives PAR for the read data phases.
AD[13]	AF9	PCI	I/O	Multiplexed Address or Data Bit 13
AD[09]	AF10	PCI	I/O	Multiplexed Address or Data Bit 9
AD[06]	AF11	PCI	I/O	Multiplexed Address or Data Bit 6
XIO_SEL[2]	AF12	MISC	I/O	External I/O Select2
XIO_ACK	AF13	MISC	I/O	XIO Acknowledge (EEPROM)
GPIO[6]	AF14	GPIO	I/O	General Purpose Input/Output Bit 6
I2S_IO_OSCLK	AF15	AVIF	I/O	Audio IN/OUT OverSample Clock
I2S_IO_SD[2]	AF16	AVIF	I/O	Audio IN/OUT Data Bit 2
SPDIF_IN	AF17	AVIF	I	Multi-ch/SPDIF Input
DV1_DATA[7]	AF18	DVB	I/O	ITU-656 VIP Data Bit 7
DV1_DATA[3]	AF19	DVB	I/O	ITU-656 VIP Data Bit 3
DV1_VALID	AF20	DVB	I/O	ITU-656 VIP Data Valid
I2S_IN1_WS	AF21	AVIF	I/O	Audio IN1 Word Select
I2S_IN2_WS	AF22	AVIF	I/O	Audio IN2 Word Select
DV2_DATA[7]	AF23	DVB	I	Digital Video Transport Stream2 Data Bit 7

V _{SS}	AF26	PWR	-	System Ground

6.2.1 Multi-function pins

Table 17 identifies and describes alternate signals that are available in the PNX8526. In Section 6.2 alternate signals are also identified by a hash (#) within each functional group of signals.

Remark: The PNX8526 has a number of General Purpose Input Output (GPIO) pins. Some of these are dedicated pins, while others are configured as alternate signals on multi function pins, as described below. The standard function of these pins may not be required in some system configurations.

For more details on GPIO functionality, see *PNX8526 User Manual, Chapter 10*.

Table 17: Multiplexed (MUX) pins

In this table, "Type" reflects mux pin function only. A pin may have other "Type" capabilities as noted in its functional group. See Section 6.2 for more details.

Pin	MUX contacts Primary signal and Alternate Function	Type	Description
AF15	I2S_IO_OSCLK	I/O	Audio IN/OUT Oversample Clock
	GPIO 45	I/O	General Purpose Input/Output 45
AE15	I2S_IO_SCK	I/O	Audio IN/OUT Serial Clock
	GPIO 46	I/O	General Purpose Input/Output 46
AC15	I2S_IO_WS	I/O	Audio IN/OUT Word Select
	GPIO 47	I/O	General Purpose Input/Output 47
AD15	I2S_IO_SD[3]	I/O	Audio IN/OUT Data Bit 3
	GPIO 51	I/O	General Purpose Input/Output 51
AF16	I2S_IO_SD[2]	I/O	Audio IN/OUT Data Bit 2
	GPIO 50	I/O	General Purpose Input/Output 50
AE16	I2S_IO_SD[1]	I/O	Audio IN/OUT Data Bit 1
	GPIO 49	I/O	General Purpose Input/Output 49
AD16	I2S_IO_SD[0]	I/O	Audio IN/OUT Data Bit 0
	GPIO 48	I/O	General Purpose Input/Output 48
R1	DV_CLK2	O	Digital Video Clock2 for secondary display channel from AICP
R2	DV_OUT2[9]	O	Digital Video Output2, Bit 9 for secondary display channel from AICP
	SPY_OUT[9]	O	SPY Micro-Architecture Output signal, Bit 9
R4	DV_OUT2[8]	O	Digital Video Output2, Bit 8 for secondary display channel from AICP
	SPY_OUT[8]	O	SPY Micro-Architecture Output signal, Bit 8
	DSU_TPC1	O	Debug Support Unit1, TPC1
R3	DV_OUT2[7]	O	Digital Video Output2, Bit 7 for secondary display channel from AICP
	SPY_OUT[7]	O	SPY Micro-Architecture Output signal, Bit 7
	DSU_TPC0	O	Debug Support Unit0, TPC0

Table 17: Multiplexed (MUX) pins...continued

In this table, "Type" reflects mux pin function only. A pin may have other "Type" capabilities as noted in its functional group. See Section 6.2 for more details.

Pin	MUX contacts Primary signal and Alternate Function	Type	Description
T1	DV_OUT2[6]	O	Digital Video Output2, Bit 6 for secondary display channel from AICP
	SPY_OUT[6]	O	SPY Micro-Architecture Output signal, Bit 6
	DSU_PCST1[2]	O	Program Counter Status1, Bit 2
T2	DV_OUT2[5]	O	Digital Video Output2, Bit 5 for secondary display channel from AICP
	SPY_OUT[5]	O	SPY Micro-Architecture Output signal, Bit 5
	DSU_PCST1[1]	O	Program Counter Status1, Bit 1
T3	DV_OUT2[4]	O	Digital Video Output2, Bit 4 for secondary display channel from AICP
	SPY_OUT[4]	O	SPY Micro-Architecture Output signal, Bit 4
	DSU_PCST1[0]	O	Program Counter Status1, Bit 0
U1	DV_OUT2[3]	O	Digital Video Output2, Bit 3 for secondary display channel from AICP
	SPY_OUT[3]	O	SPY Micro-Architecture Output signal, Bit 3
	DSU_PCST0[2]	O	Program Counter Status0, Bit 2
T4	DV_OUT2[2]	O	Digital Video Output2, Bit 2 for secondary display channel from AICP
	SPY_OUT[2]	O	SPY Micro-Architecture Output signal, Bit 2
	DSU_PCST0[1]	O	Program Counter Status0, Bit 1
U2	DV_OUT2[1]	O	Digital Video Output2, Bit 1 for secondary display channel from AICP
	SPY_OUT[1]	O	SPY Micro-Architecture Output signal, Bit 1
	DSU_PCST0[0]	O	Program Counter Status0, Bit 0
U3	DV_OUT2[0]	O	Digital Video Output2, Bit 0 for secondary display channel from AICP
	SPY_OUT[0]	O	SPY Micro-Architecture Output signal, Bit 0
	DSU_CLK	O	Debug Support Unit Clock
K2	I2S_OUT2_OSCLK	O	Audio OUT2 Oversample Clock
	DV_OUT[20]	O	AICP RGB Data Bit 20
	SPY_OUT[11]	O	SPY Micro-Architecture Output signal, Bit 11
L3	I2S_OUT2_SCK	I/O	Audio OUT2 Serial Clock
	DV_OUT[21]	O	AICP RGB Data Bit 21
	SPY_OUT[10]	O	SPY Micro-Architecture Output signal, Bit 10
K1	I2S_OUT2_WS	I/O	Audio OUT2 Word Select
	DV_OUT[22]	O	AICP RGB Data Bit 22
	DBG_EXT_STOP	I	External Stop Request signal
L4	I2S_OUT2_SD	O	Audio OUT2 Data
	DV_OUT[23]	O	AICP RGB Data Bit 23 (Most Significant Bit)
	CLK_SPY	O	SPY Micro-Architecture Clock Output signal
AE17	DV1_DATA[9]	I	ITU-656 VIP Data Bit 9 (Most Significant Bit)
	GPIO 42	I/O	General Purpose Input/Output 42
AD17	DV1_DATA[8]	I	ITU-656 VIP Data Bit 8
	GPIO 41	I/O	General Purpose Input/Output 41

Table 17: Multiplexed (MUX) pins...continued

In this table, "Type" reflects mux pin function only. A pin may have other "Type" capabilities as noted in its functional group. See Section 6.2 for more details.

Pin	MUX contacts Primary signal and Alternate Function	Type	Description
R25	SC1_OFFN	I	Smartcard Off
	ICAM1_DETECT	I	ICAM1 Detect
R23	SC1_CMD	O	Smartcard Command
	ICAM1_SETVCC	O	ICAM1 VCC
R24	SC1_RST	O	Smartcard Reset
	ICAM1_RESET	O	ICAM1 Reset
R26	SC1_SCCK	O	Smartcard Clock
	ICAM1_CLK	O	ICAM1 Clock
T26	SC1_DA	I/O	Smartcard1 Data
	ICAM1_C7	I/O	ICAM1 C7

[1] *These pins are included in the XIO set. Refer to *PNX8526 User Manual, Chapter 8* for additional functions.

[2] **The ICAM1_SETVPP and ICAM1_C8 signals are automatically selected when the ICAM function is selected. Refer to [Table 18](#) (Offset 0x04 D600 IO_MUX_CTR). Selecting GPIO mode will disable this ICAM functionality.

7. Functional description

[Figure 3](#) shows a block diagram of a typical PNX8526-based system. The system shown is a "standalone system" which uses the internal MIPS host.

The PNX8526 runs on a single 27 MHz xtal from which all internal and external clocks are derived by on-chip synthesizers. The PNX8526 boots directly from attached Flash memory or ROM. If desired, custom boot methods can be programmed using the optional I²C boot EEPROM.

The PNX8526 has three Digital Video inputs that accept digitized analog video (ITU-656), although only two ITU-656 streams can be processed simultaneously. Two of these inputs, DV2 and DV3, can also accept scrambled transport streams.

The DV inputs support parallel transport stream formats. In addition, a single incoming 1394 transport stream is supported. Two selected transport streams can undergo internal de-scrambling and decoding.

Based on the system implementation, one or both transport streams may pass through Point of Deployment (POD) or Common Interface (CI) conditional access modules before transfer into the PNX8526. Either a single companion IC, such as the SCM Microsystems CIMaX™, or two CIMaX™ chips can be used. In the latter case, it is possible to handle dual decoding no matter which conditional access system is used.

The PNX8526 contains on-chip DVB, MULTI2 and DES hardware de-scramblers, as well as an ICAM verifier. The entitlement system for these de-scramblers is provided via two Smartcard interfaces.

The TM32 CPU does further processing on the result of the transport stream de-mux.

For MPEG2 video, a slice level HL MPEG2 video decoder performs the majority of the MPEG2 algorithm. This MPEG decoder is capable of full-resolution decoding. The TM32 CPU does all MPEG2 processing above the slice level. Two simultaneous SD streams or one HD stream may be processed.

All audio processing is done by the TM32 CPU. Compressed audio will be present in memory from either the transport stream de-multiplex or from the SPDIF input port. The SPDIF input port is intended primarily for DTV applications where a SPDIF source is available from an external source device, such as a DVD player. PCM (stereo sample) audio is present in memory from the I²S input ports or SPDIF input. Two AC-3 (or equivalent) compressed audio streams may be decoded simultaneously. The TM32 CPU may also process effects, enhancements and mix the audio data. Multi-channel compressed audio or down-mixed stereo PCM audio is transmitted over the SPDIF output interface. Multi-channel audio samples are Dolby Pro Logic™ down-mixed into the two stereo I²S interfaces to the PNX8510 companion IC. In addition to the two I²S inputs and two I²S outputs, a bi-directional I²S interface is provided. This allows connection of other audio inputs or outputs— headphones, for example. Note that there is not enough compute power to support encoding of multi-channel compressed audio simultaneous with video processing. So the multi-channel compressed audio transmitted over SPDIF must be from one of the original compressed sources.

Graphics rendering may be accomplished with the MIPS or the TM32 CPU by utilizing the 2D Drawing and DMA engine. This engine can perform fast area fills, 3-operand bitblt, monochrome data expansion, and lines. It can also be used as a generic DMA engine to transfer data between memory locations on a byte-aligned basis. An alpha bitblt capability is also provided to allow for anti-aliased text and lines as well as source/destination blending operations.

Once all video and graphics data for specific fields or frames has been generated in memory, the video display pipeline starts processing those images for display. The video processing functions include 6-tap horizontal/vertical scaling, anti-flicker filtering, and de-interlacing (when progressive output is required). The processed images are then combined for each output. Up to four surfaces of any supported format may be combined to produce the primary display output. Up to two surfaces are combined to produce the secondary output. Compositing of more surfaces for future video algorithms is possible by using the TM32 CPU and/or the memory based scaler prior to invoking the compositing/display engine. This is subject to CPU and memory bandwidth availability.

The PNX8526 contains a 1394 interface with 5C copy protection. The PNX8526 1394 can simultaneously transmit two transport streams while receiving one transport stream. The transmitted streams can be partial transport streams (created by PID filtering of an input) or one of the two streams can be software generated. In the case of receiving a scrambled 1394 transport stream input, the stream can either use the on-chip de-scramblers, or may be routed to the external companion CA IC for de-scrambling by the POD/CI CA module(s).

The PNX8526 contains a variety of peripheral interfaces to support both ASTB and DTV requirements. There are two Smartcard interfaces, two USB ports, two I²C ports, one IrDA Data UART and two general purpose UARTs, one of which (UART3) is multiplexed with an SSI interface for soft modem support. The PNX8526 also contains an integrated IDE controller, which only requires an external isolation buffer

to implement a full disk interface with sustained speeds up to 10 MB/s. A third-party PCI Super I/O chip may be utilized to provide peripheral functionality not contained on the PNX8526. Functions such as IEEE-1284, 10/100 Ethernet, floppy drive support, UDMA66 IDE controllers and others are currently available in low-cost, commercially available parts.

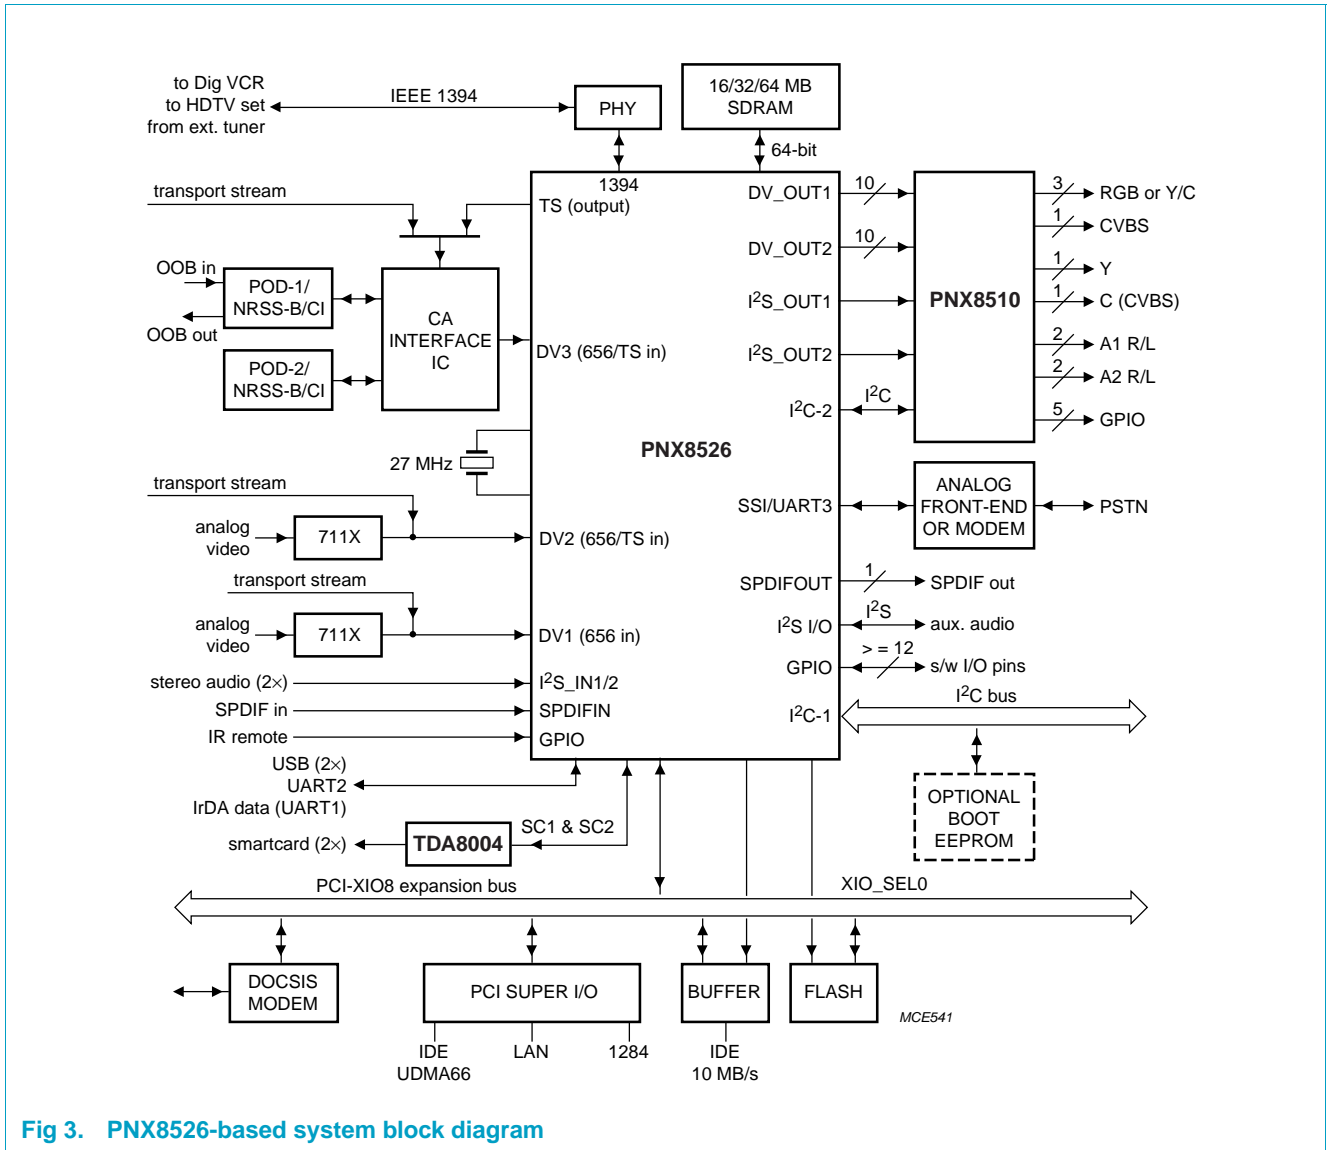

Fig 3. PNX8526-based system block diagram

8. I/O multiplexer control register

The I/O Multiplexer Control register is used to configure the multi function pins to alternate functions as described in Table 17. Control is achieved via the Global 2 register IO_MUX_CTRL Table 18.

Table 18: Global 2 registers

Bit	Symbol	Access	Value	Description
0x04 D600 IO_MUX_CTRL				
31:15	Not used			Ignore during writes and read as zeroes.
14	AIO_MUX_SEL	R/W	0x0	I2S_IO Audio mode: 0 = Select I2S_IO as Audio Out. 1 = Select I2S_IO as Audio In.
13	SSI_SEL	R/W	0x0	SSI or UART3 mode: 0 = Select UART3. 1 = Select SSI.
12	RGB24_SEL	R/W	0x0	Audio Out2 or RGB mode: 0 = Select Audio Out2. 1 = Select RGB (DV_OUT [23:20]).
11:10	SMCRD2_MUX_CTRL	R/W	0x0	ICAM or SmartCard2 mode: 00 = SmartCard1 module ports go to SmartCard2 pins. 01 = SmartCard2 module ports go to SmartCard2 pins. 10 = ICAM1 module ports go to SmartCard2 pins. 11 = ICAM2 module ports go to SmartCard2 pins.
9:8	SMCRD1_MUX_CTRL	R/W	0x0	ICAM or SmartCard2 mode: 00 = SmartCard1 module ports go to SmartCard1 pins. 01 = SmartCard2 module ports go to SmartCard1 pins. 10 = ICAM1 module ports go to SmartCard1 pins. 11 = ICAM2 module ports go to SmartCard1 pins.
7	Not used		-	Ignore during writes and read as zeroes.
6:4	VIP2_MUX_CTRL[2:0]	R/W	0x0	VIP2 module selection: 000 = VIP data from DV1 port 001 = VIP data from DV2 port 010 = VIP data from DV3 port 011 = VIP data from DV_OUT1(AICP1) port 100 = 1394 data from link core
3	Not used		-	Ignore during writes and read as zeroes.

9. Power supply sequencing

Power application and power removal should obey the following rules:

9.1 Power on sequence

- Apply power to V_{DD} 1.26 V
- Allow V_{DD} 1.26 V to stabilize (approx. 100 ms recommended)
- Apply power to V_{DD} 3.3 V

9.2 Power off sequence

- Power may be removed from V_{DD} 3.3 V and V_{DD} 1.26 V at the same time
- Otherwise remove V_{DD} 3.3 V followed by 1.26 V

10. Limiting values

Table 19: Maximum ratings

Symbol	Parameter	Min	Max	Typical	Unit
T_{amb}	Ambient temperature	0	70	-	°C
T_{stg}	Storage temperature	-40	+125	-	°C
T_j	Junction temperature	-	100	-	°C
	3-volt I/O pin voltage with respect to V_{SS}	-0.5	$V_{DD}+0.5$	-	V
	5-volt tolerant I/O pin voltage with respect to V_{SS}	-0.5	5.5	-	V
	I/O with Non-Schmitt trigger input voltage threshold	1.46	1.76	-	V
	I/O with Schmitt trigger input threshold VILT	0.93	1.06	-	V
	I/O with Schmitt trigger input threshold VIHT	1.66	1.79	-	V
	I/O transient pin voltage	-	10	-	V
	DC supply voltage (V_{DD} I/O pad)	3.0	3.6	-	V
	DC supply voltage (V_{DDC} core logic)	1.20	1.32	-	V
	Dynamic Power Dissipation	-	2	-	W
	Static Power Dissipation (AICP off)	-	1	-	W
	Electrostatic Discharge (Human Body Model)	-	± 1.5	-	kV

11. Thermal characteristics

PNX8526 can be used in different environments creating different junction temperatures.

The thermal resistance from junction to ambient (i.e. θ_{ja}) of the PNX8526 in its HBGA456 package is around 11.7 C/W. This value is achieved using natural convection, no external heatsink and using a JEDEC defined high-conductive board (see JEDEC standards 51-2 and 51-7 for details).

Given the power dissipation of the PNX8526 and the ambient temperature inside the enclosure, the expected junction temperature can be calculated using the following equation:

$$T_j = T_{amb} + P \times R_{th(j-a)}$$

In some applications the junction temperature may be judged too high, reducing the acceptable lifetime (see [Section 15](#)). However cooling can be improved by fitting an additional external heatsink, or increasing the airflow around the device. [Table 20](#) shows the improvements that can be expected if these measures are taken.

Table 20: PNX8526 thermal data

Heatsink size = 37 x 37 x 10 mm

PNX8526	Thermal resistance $R_{th(j-a)}$ (C/W)		
	Airflow		
	0 m/s	1 m/s	2 m/s
Standard	11.7	10.0	8.5
With external h'sink	9.5	7.6	6.3

12. Static characteristics

The characteristics listed in the following tables apply to standard operating conditions, unless otherwise noted. All voltages are referenced to V_{SS} (0V Ground). Positive current flows into the referenced pin. The standard operating voltage range is $V_{DD} = 3.3 \pm 0.3 V_{DC}$ and $V_{DDC} = 1.26 \pm 0.06 V_{DC}$. All digital I/O pins are 3.3 V tolerant.

In all cases described below, digital $V_{DD} = 3.3 V + 5\%$ and operating temperature is 0° to $70^\circ C$.

All AC timings are based on a 30 pF test load and are measured at a 1.6 V threshold (see Figure 4) Actual I/O voltage threshold is dependant on pad type e.g., Schmitt trigger input (see Section 6.1).

Fig 4. General AC characteristics

The AC voltage characteristics for active signal pins of the controller are listed in Table 21. Signal names for the PCI bus configuration are listed, as well as the minimum and maximum voltage, current, and capacitance for each pin.

Table 21: Digital AC/DC characteristics

Symbol	Parameter	Min	Max	Typical	Unit
V_{IL}	Input Low Voltage	-0.5	+0.8	-	V
V_{IH}	Input High Voltage	2.4	$V_{dd} + 0.5$	-	V
V_{OL}	Output Low Voltage	V_{ss}	$V_{ss} + 0.4$	-	V
V_{OH}	Output High Voltage	2.4	-	-	V
$I_{OL1}^{[1]}$	Output Low Current	-	5	-	mA
I_{OH1}	Output High Current	-	-5	-	mA
$I_{OL2}^{[2]}$	Output Low Current	-	8	-	mA
I_{OH2}	Output High Current	-	-8	-	mA
$I_{OL3}^{[3]}$	Output Low Current	-	12	-	mA
I_{OH3}	Output High Current	-	-12	-	mA
$I_{OL4}^{[4]}$	Output Low Current	-	14	-	mA
I_{OH4}	Output High Current	-	-14	-	mA

Table 21: Digital AC/DC characteristics...continued

14. Delta compared to PNX8525

There are a number of differences between the PNX8526 and the PNX8525 with respect to the physical interfacing of the device. These differences are described in [Table 38](#).

Table 38: Differences - 8525 / 8526

Characteristic	PNX8525	PNX8526
Core supply voltage	1.8 V ± 5%	1.26 V ± 0.06 V
I2C-bus pads	GPIO pads with schmitt trigger and pull-ups	Special I2C pads designed to meet the I2C specification
IEEE-1394 pads	GPIO pads with schmitt trigger and pull-ups	Special IEEE-1394 pads designed to meet the IEEE-1394 Link to Phy specification
PCI Interface	Supports 5 V tolerant interface with 3.3 V signalling	No 5 V tolerant interface, all signals limited to 3.3 V
System reset output (SYS_RSTN_OUT)	Drive capability 12 mA	Drive capability 8 mA
Clock output (PLL_OUT)	Drive capability 12 mA	Drive capability 8 mA
SPDIF output		

Table 38: Differences - 8525 / 8526...continued

Characteristic	PNX8525	PNX8526
	Drive capability 16 mA	Drive capability 14 mA
DV1 port, SSI, Uart2, Smart Card1, Smart Card2		
	Drive capability 4 mA	Drive capability 5 mA, INputs support Hysteresis
I2S CLK and WS		
	Drive capability 4 mA	Drive capability 5 mA
TS interface and I2S data lines		
	Hysteresis on inputs not supported	Hysteresis on inputs supported
SDRAM interface		
	Supports 5 V tolerant signalling, with 3.3 V drive. (AD[11:0],CLK[1:0], RAS,CAS, CS, BA[1:0] have drive capability 16 mA)	No 5 V tolerant signalling. Drive capability 14 mA
XIO SEL[2:0], ACK, A25		
	Drive capability 12 mA	Drive capability 8 mA
Peripheral power supply		
	Single connection on PCB for all V_{DD} bondpads	Requires separation of V_{DDC} into 3 segments, each segment filtered and star connected back to source. ^[1]
Core power supply		
	Single connection on PCB for all V_{DDC} bondpads	Requires separation of V_{DDC} into 2 segments, each segment filtered and star connected back to source. ^[2]

- [1] The new connections are
 V_{DD1} - The I/O supply connection
 V_{DD2} - Analogue clock generation unit (CAB-Custom Analogue Block)
 V_{DD3} - Trimedia™ clock generation PLL
- [2] The new connections are
 V_{DDC1} - Main core supply connection
 V_{DDC2} - 1.728GHz PLL supply connection

15. Lifetime versus temperature

The relationship between operating (junction) temperature and the expected lifetime of a device is shown in [Figure 20](#).

Referring to **Figure 20**, at a junction temperature of 110 °C a 10 year lifetime can be expected (8 hours/day). If increased to 125 °C, lifetime can be reduced to 4 years. Junction temperature can be influenced by following the guidelines in **Section 11**.

16. Package outline

17. Soldering

17.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *Data Handbook IC26; Integrated Circuit Packages* (document order number 9398 652 90011).

There is no soldering method that is ideal for all IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended. In these situations reflow soldering is recommended.

17.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 220 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA and SSOP-T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 235 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

17.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.

- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.
 The footprint must incorporate solder thieves at the downstream end.
- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

17.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

17.5 Package related soldering information

Table 39: Suitability of surface mount IC packages for wave and reflow soldering methods

Package ^[1]	Soldering method	
	Wave	Reflow ^[2]
BGA, LBGA, LFBGA, SQFP, SSOP-T ^[3] , TFBGA, VFBGA	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ^[4]	suitable
PLCC ^[5] , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ^{[5][6]}	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ^[7]	suitable
PMFP ^[8]	not suitable	not suitable

[1] For more detailed information on the BGA packages refer to the *(LF)BGA Application Note* (AN01026); order a copy from your Philips Semiconductors sales office.

[2] All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the *Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods*.

- [3] These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ °C} \pm 10\text{ °C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- [4] These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- [5] If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- [6] Wave soldering is suitable for LQFP, QFP and TQFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- [7] Wave soldering is suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- [8] Hot bar or manual soldering is suitable for PMFP packages.

19. Data sheet status

Level	Data sheet status ^[1]	Product status ^{[2][3]}	Definition
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

- [1] Please consult the most recently issued data sheet before initiating or completing a design.
- [2] The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
- [3] For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status

customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes – Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

20. Definitions

Short-form specification – The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition – Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information – Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

21. Disclaimers

Life support – These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors

24. Contact information

For additional information, please visit <http://www.semiconductors.philips.com>.

For sales office addresses, send an email to: sales.addresses@www.semiconductors.philips.com.

22. Licenses

Purchase of Philips I²C components

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.

23. Trademarks

Nexperia – is a trademark of Koninklijke Philips Electronics N.V.

TriMedia – is a trademark of TriMedia Technologies Inc.

OpenCable – is a trademark of Cable Television Laboratories Inc.

Dolby ProLogic – is a registered trademark of Dolby Laboratories

CIMaX – is a registered trademark of SCM Microsystems Inc.
