## 1.0 Description

The Aeroflex Circuit Technology "RISC TurboEngine" is a full military temperature range 64 bit, super-pipelined RISC microprocessor with 1M Byte of secondary cache memory packaged in a high speed multichip module (MCM). The module contains the following components:

- (1) R4400SC/MC, a 3.3V powered RISC microprocessor.
- (11) SRAMs, 64K by 16.
- (3) Buffers and (3) Passive components for phase lock loop operation.

A Primary cache only version, the R4400PC is also available in the same package or 179 pin PGA

## 2.0 Flat Package Outline

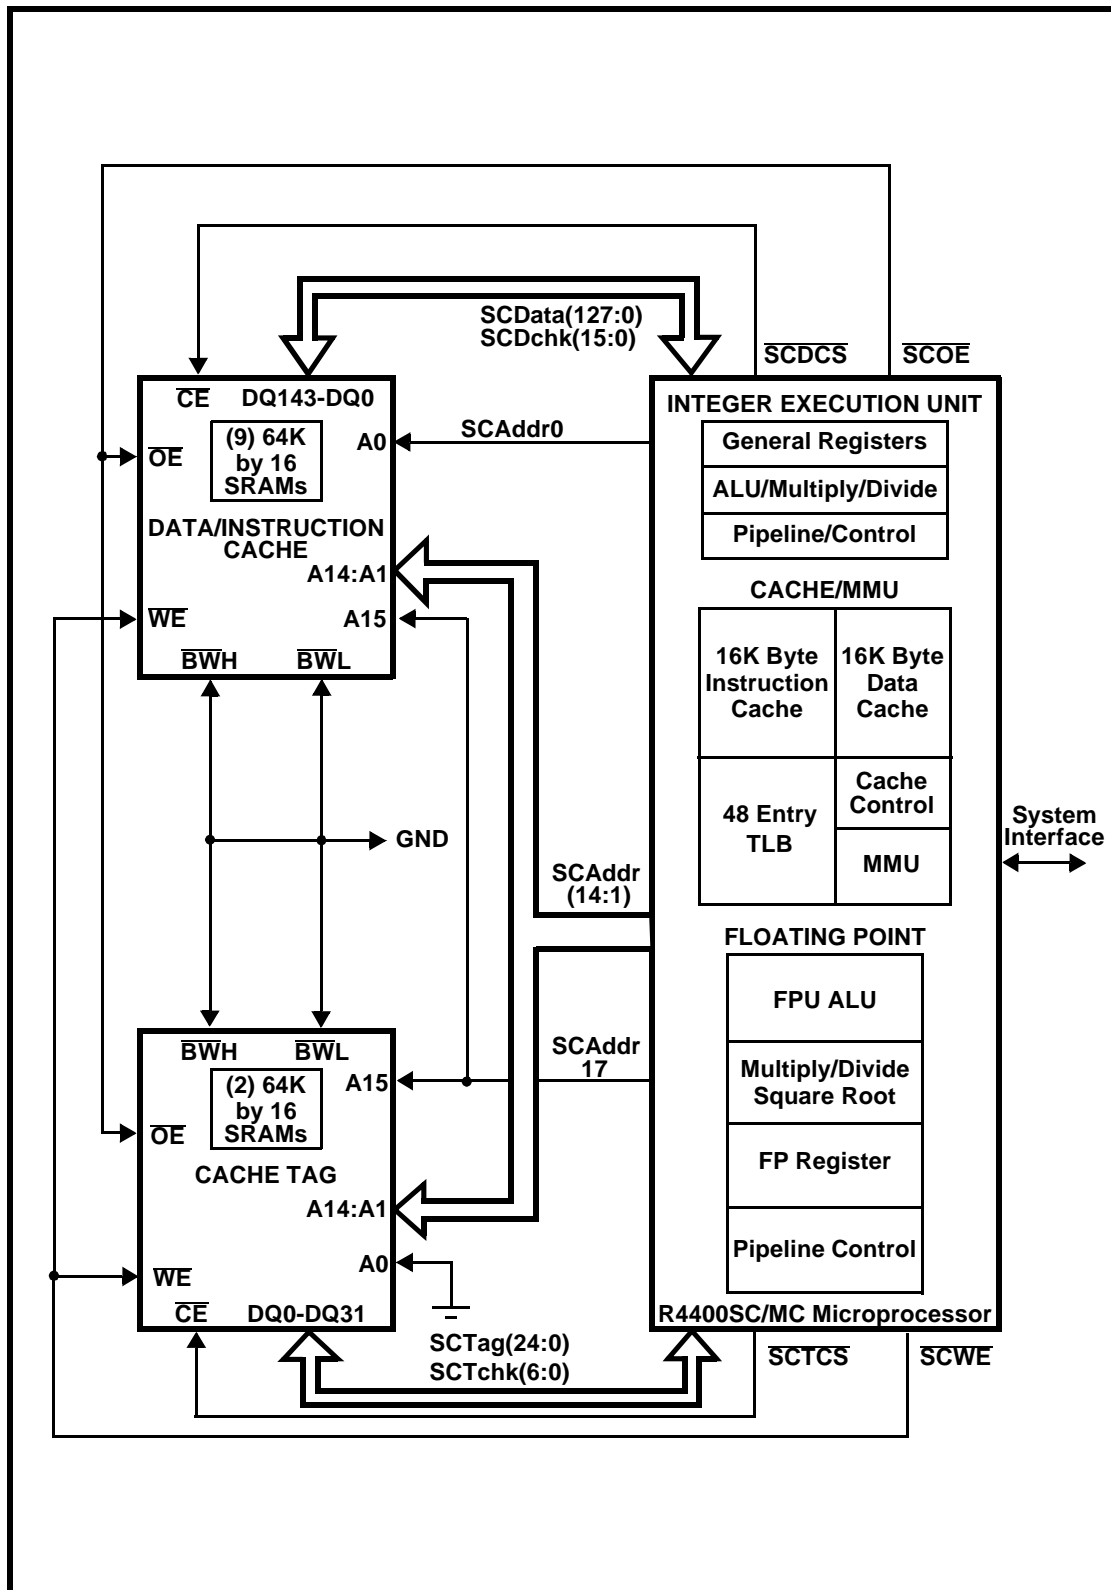

### 3.0 Electrical Features

- Low power dissipation, 3.3 Volt powered, 64 bit superpipelined RISC R4400 microprocessor
  - Highly integrated CPU with integer unit, FPA, MMU, I&D cache
  - Balanced integer & floating point performance
  - Exploits 2-level instruction-level parallelism
  - No issue restrictions on the instructions used
- Integer unit
  - 32 entry, 64 bit wide register
  - ALU
  - Dedicated multiplier/divider
- Super pipelined FPA
  - 32/16 entry 32/64 bit register file in a 32 bit mode
  - 32 entry 64 bit register file in 64 bit mode
  - Supports single and double precision.
  - Supports ANSI/IEEE Standard 754-1985
- Memory management unit
  - 48 entry TLB for fast virtual-to-physical address translation, software managed cntrl regstrs
  - Programmable page sizes from 4K bytes to 16M bytes
  - Total physical address space encompasses 64G bytes
  - One pair of pages per TLB entry, each programable in size from 4K bytes to 16M bytes
- JTAG boundary scan capability for testing module interconnects.
- Internal 1M byte secondary cache SRAM configured as a split cache with instruction and data sections separate. Can be factory configured as unified.
- Provides 16 bit ECC on secondary cache data line, 7 bit ECC on tag line.
- Minimum clock rate 50 mHz with no wait states.
- +3.3 Volt P.S.(10 Watts Max.power dissipation) operation is standard.

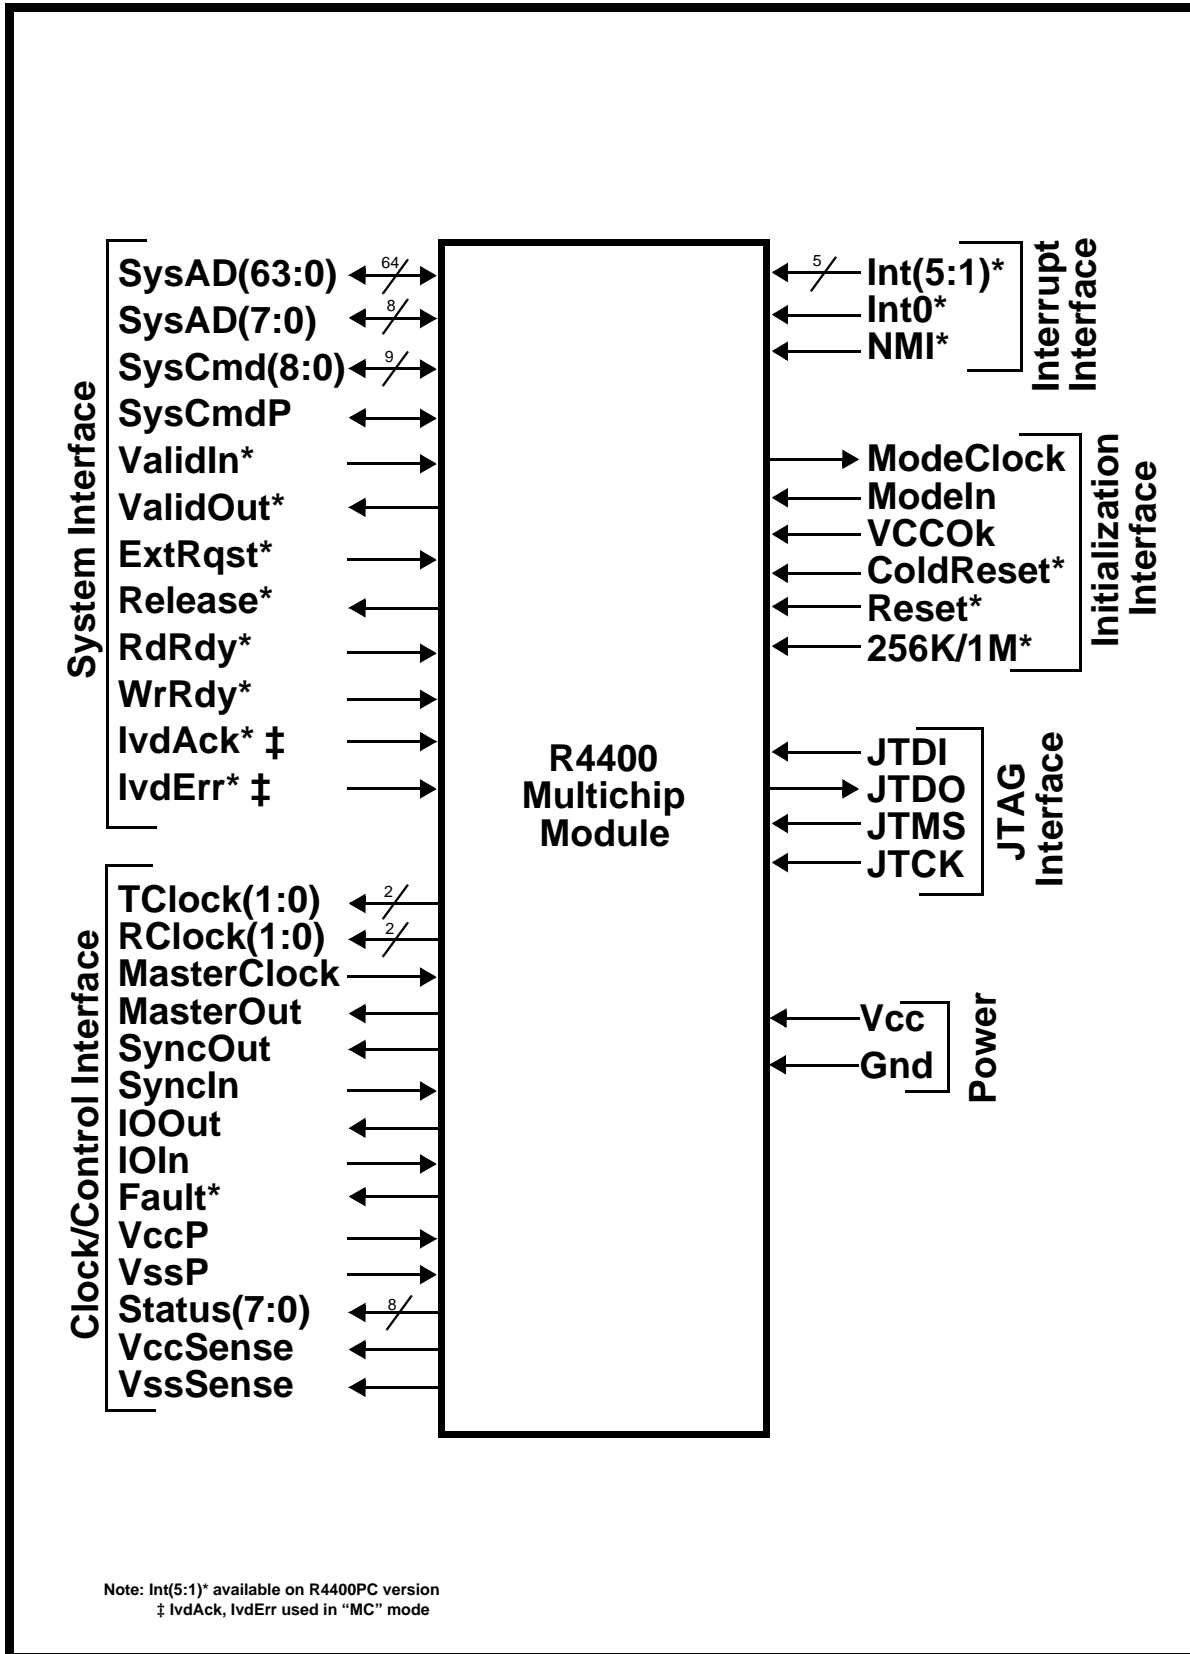

### 4.0 Mechanical Features

- Small sizes, 2.5”L X 1.75”W X 0.175”H, 280 pin surface mount flat package or alternate 1.86”L X 1.86”W X 0.145”H, 179 pin PGA Package.
- Full military operating temperature range of -55 °C to +125 °C, case temperature
- Designed to meet military specifications, manufactured and tested in Aeroflex’s MIL-PRF-38534 certified facility.

## 5.0 INTERNAL BLOCK DIAGRAM(SC Version)

## 6.0 Module Symbolic Interface Connections

## 7.0 Signal Descriptions

### System Interface Signals

SysAD(63:0)	I/O	<b>System address/data bus:</b> A 64 bit address and data bus for communication between the processor and an external agent
SysADC(7:0)	I/O	<b>System address/data check bus:</b> An 8 bit bus containing check bits for the SysAD bus
SysCmd(8:0)	I/O	<b>System command/identifier bus parity:</b> A 9 bit bus for command and data identifier transmission between the processor and an external agent
SysCmdP	I/O	<b>System command /data identifier bus parity:</b> A single, even parity bit for thr SysCmd bus
ValidIn*	I	<b>Valid Input:</b> An external agent asserts ValidIn* when it is driving a valid address or data on the SysAD bus and a valid command or data identifier on the SysCmd bus
ValidOut*	O	<b>Valid Output:</b> The processor asserts ValidOut* when it is driving a valid address or data on the SysAD bus and a valid command or data identifier on the SYSCMD bus
ExtRqst*	I	<b>External Request:</b> An external agent asserts ExtRqst* to request the use of the system interface. The processor grants the request by asserting Release*
Release*	O	<b>Release Interface:</b> In response to the assertion of ExtRqst*, the processor asserts Release* to signal the requesting device that the system interface is available
RdRdy*	I	<b>Read ready:</b> The external agent asserts RdRdy*to indicate that it can accept processor read, invalidate, or update requests in both overlap and non-overlap mode or can accept a read followed by a potential invalidate or update request in the overlap mode
WrRdy*	I	<b>Write ready:</b> An external agent asserts WrRdy* when it can accept a processor write request
IvdAck*	I	<b>Invalidate acknowledge:</b> An external agent asserts IvdAck* to signal successful completion of a processor invalidate or update request (MC only)
IvdErr*	I	<b>Invalidate error:</b> An external agent asserts InvErr* to signal unsuccessful completion of a processor invalidate or update request(MC only)

## Clock/Control Interface Signals

TClock(1:0)	O	<b>Transmit clocks</b> : Two identical transmit clocks that establish the system interface frequency
RClock(1:0)	O	<b>Receive clocks</b> : Two identical receive clocks that establish the system interface frequency
MasterClock	I	<b>Master clock</b> : Master clock input establishes the processor operating frequency
Masterout	O	<b>Master clock out</b> : Master clock output aligned with MasterClock
SyncOut	O	<b>Synchronization clock out</b> : Synchronization clock output must be connected to SyncIn through an interconnect that models the interconnect between MasterOut, TClock, RClock, and the external agent.
SyncIn	I	<b>Synchronization clock in</b> : Synchronization clock input
IOOut	O	<b>I/O output</b> : Output slew rate control feedback loop output. Must be connected to IOIn through a delay loop that models the I/O path from the processor to an external agent.
IOIn	I	<b>I/O input</b> : Output slew rate control feedback loop input (see IOOut)
Fault*	O	<b>Fault</b> : The processor asserts Fault to indicate a mismatch output of boundry comparators
VccP	I	<b>Quiet Vcc for the PLL</b> : Quiet Vcc for the internal phase lock loop
VssP	I	<b>Quiet Vss for the PLL</b> : Quiet Vss for the internal phase lock loop
Status(7:0)	O	<b>Status</b> : An 8 bit bus that indicates the current operation status of the processor
VccSense	I/O	<b>Vcc sense</b> : This is a special pin used for testing and characterization. The voltage at this pin directly shows the behavior of the on chip Vcc.
VssSense	I/O	<b>Vss sense</b> : VssSense provides a separate, direct connection from the on-chip Vss node to a package pin without attaching to the in-package ground planes. VssSense should be connected to Vss in functional system designs.

**Interrupt Interface Signals:** These signals comprise the interface used by external agents to interrupt the R4400 processor

Int(5:1)*	I	<b>Interrupt:</b> Five of six general processor interrupts, bit-wise ORed with bits 5:1 of the interrupt register. This feature available on the R4400PC version only
Int0*	I	<b>Interrupt:</b> One of six general processor interrupts, bit wise ORed with bit 0 of the interrupt register
NMI*	I	<b>Nonmaskable interrupt:</b> Nonmaskable interrupt ORed with bit 6 of the interrupt register

**Initialization Interface:** These signals comprise the interface by which an external agent initializes the R4400 operating parameters.

ColdReset*	I	<b>Cold Reset:</b> This signal must be asserted for a power on reset or a cold reset. The clocks SClock, TClock, and RClock begin to cycle and are synchronized with the de-assertion edge of ColdReset*. ColdReset must be de-asserted synchronously with MasterOut.
ModeClock	O	<b>Boot Mode Clock:</b> Serial boot-mode data clock output at the system clock frequency divided by 256
ModeIn	I	<b>Boot mode data in:</b> Serial boot-mode data input.
Reset*	I	<b>Reset:</b> This signal must be asserted for any reset sequence. It may be asserted synchronously or asynchronously for a cold reset, or synchronously to initiate a warm reset. Reset must be de-asserted synchronously with MasterOut.
VccOk	I	<b>Vcc is OK:</b> When asserted, this signal tells the R4400 that the 3.3 Volt power supply has been above 3.15 Volts for more than 100 milliseconds & will remain stable . Assertion of VccOK starts initialization sequence.
256K/1M*	I	<b>Cache size Select:</b> Must be connected to ground to enable the full 1M Byte of cache. Cache size will be 256K if pin is left unconnected.

### JTAG Interface Signals

JTDI	I	<b>JTAG data in:</b> Data is serial, scanned in thru this pin
JTCK	I	<b>JTAG clock input:</b> The processor outputs a serial clock on JTCK. On the rising edge of JTCK, both JTDI and JTMS are sampled.
JTDO	O	<b>JTAG data out:</b> Data is serial, scanned out thru this pin
JTMS	I	<b>JTAG:</b> JTAG command signal indicates that the incoming serial data is command clear.
