## Typical Applications

## - CDMA/TDMA/DCS 1900 PCS Systems

- PHS 1500/WLAN 2400 Systems
- General Purpose Downconverter
- Micro-Cell PCS Base Stations
- Portable Battery-Powered Equipment

## Product Description

The RF2459 is a monolithic integrated downconverter for PCS, PHS, and WLAN applications. The IC contains all of the required components to implement the RF functions of the downconverter. It contains a double-balanced Gilbert cell mixer and a balanced IF output. The mixer's high third-order intercept point makes it ideal for digital cellular applications. The IC is designed to operate from a single 3V power supply.

Functional Block Diagram

Package Style: MSOP-8

## Features

- Extremely High Dynamic Range
- Single 3V Power Supply
- 1500 MHz to 2500 MHz Operation

## Preliminary

RF2459

| Pin | Function | Description | Interface Schematic |
| :---: | :---: | :---: | :---: |
| 1 | LO IN | Mixer LO single-ended input. The pin is internally DC blocked. External matching sets impedance. |  |
| 2 | GND2 | Ground for downconverter. Keep traces physically short and connect directly to ground plane for best performance. |  |
| 3 | VCC | Supply voltage for downconverter. External RF bypassing is required. The trace length between the bypass caps and the pin should be minimized. Connect ground sides of caps directly to ground. |  |
| 4 | GND1 | Same as pin 2. |  |
| 5 | RF IN | Mixer RF single-ended input. The pin is internally DC blocked. External matching sets input impedance. |  |
| 6 | GND3 | Same as pin 2. |  |
| 7 | IF- | IF output pin. The output is balanced. A current combiner external network performs a differential to single-ended conversion and sets the output impedance. There must be a DC path from $\mathrm{V}_{\mathrm{CC}}$ to this pin. this is normally achieved with the current combiner network. A DC blocking cap must be present if the IF filter input has a DC path to ground. |  |
| 8 | IF+ | Same as pin 7, except complementary output. |  |

## Application Schematic

## Output Interface Network

L1, C1 and R form a current combiner which performs a differential to single-ended conversion at the IF frequency and sets the output impedance. In most cases, the resonance frequency is independent of $R$ and can be set according to the following equation:

$$
f_{I F}=\frac{1}{2 \pi \sqrt{\frac{L 1}{2}\left(C 1+C_{E Q}\right)}}
$$

Where $C_{E Q}$ is the equivalent stray capacitance and capacitance looking into pins 7 and 8 . An average value to use for $\mathrm{C}_{\mathrm{EQ}}$ is 2.5 pF .
$R$ can then be used to set the output impedance according to the following equation:

$$
R=\left(\frac{1}{4 \cdot R_{\text {OUT }}}-\frac{1}{R_{P}}\right)^{-1}
$$

where $R_{\text {OUT }}$ is the desired output impedance and $R_{P}$ is the parasitic equivalent parallel resistance of L1.

C1 should be chosen as high as possible, while maintaining an $R_{P}$ of $L 1$ that allows for the desired $R_{\text {OUT }}$.

L2 and C2 serve dual purposes. L2 serves as an output bias choke, and C2 serves as a series DC block.

In addition, L2 and C2 may be chosen to form an impedance matching network if the input impedance of the IF filter is not equal to ROUT. Otherwise, L2 is chosen to be large (suggested 8.2 nH ) and C 2 is chosen to be large (suggested 22 nF ) if a DC path to ground is present in the IF filter, or omitted if the filter is DC blocked.

## Evaluation Board Schematic $R F=1.959 \mathrm{MHz}, \mathrm{IF}=210 \mathrm{MHz}$

(Download Bill of Materials from www.rfmd.com.)

1) R1, L3, C5, and C6 are chosen to produce an output impedance, $R_{\text {OUT }}$, of $1000 \Omega @ 210 \mathrm{MHz}$.
2) L4 and C7 are chosen to match the $1000 \Omega$ output impedance to $50 \Omega$ for testing purposes.
