ST7586S

4-Level Gray Scale Dot Matrix LCD Controller/Driver

INTRODUCTION

ST7586S is a driver & controller LSI for 4-level gray scale graphic dot-matrix liquid crystal display systems. It contains 384-segment and 160-common driver circuits. This chip can be connected directly to a microprocessor which accepts 8-bit parallel interface (8080-series or 6800-series type), 4-Line serial interface or 3-Line serial interface. Display data is stored into an on-chip Display Data RAM (DDRAM). It performs the Display Data RAM read/write operation without external operating clock, and the power consumption can be minimized. In addition, since all necessary power supply circuits for LCD system are built-in, ST7586S constructs a LCD display system with the fewest components.

FEATURES

Single-chip LCD controller/driver

Driver Output Circuits

- ◆ 384 segment outputs / 160 common outputs

On-chip Display Data RAM

- ◆ Capacity: 384 x 160 x 2 = 122,880 bits

Various Partial Display Features

- ◆ Applicable partial duty
- ◆ Partial window moving & data scrolling

Microprocessor Interface

- ◆ 8-bit parallel bi-directional interface supports 6800-series or 8080-series MPU
- ◆ 4-Line serial interface
- ◆ 3-Line (9-bit) serial interface

On-chip Low Power Analog Circuit

- ◆ On-chip oscillator circuit
- ◆ Voltage booster with built-in boost-capacitors
- ◆ Extremely few external components: 4 capacitors
- ◆ Built-in voltage regulator with programmable contrast
- ◆ Built-in voltage follower supports LCD bias voltage
Available bias: 1/9 ~ 1/14

Operating Voltage Range

- ◆ Digital Power (VDD1): 1.8V ~ 3.3V (TYP.)
- ◆ Analog Power (VDD2~VDD5, VDDX): 2.8V ~ 3.3V (TYP.)
- ◆ LCD operation voltage (Vop = V0-XV0) : 18V

Built-in OTP-ROM for LCD Vop Optimization

Package Type: COG

PIN DESCRIPTION

Power System

Name	Type	Description															
VDD1	Power	VDD1 is the power of interface I/O circuit.															
VDD2~5	Power	VDD2 is the analog power for internal booster. VDD3~5 are the analog power for LCD driver. VDD2~5 and VDDX are separated in ITO and connected together by FPC or PCB.															
VDDX	Power	Digital power for OSC circuit. VDD2~5 and VDDX are separated in ITO and connected together by FPC or PCB.															
VSS1	Power	Ground of interface, logic (VSS1) and OSC (VSSX) circuits. Ground system should be connected together by FPC or PCB.															
VSS2 VSS4	Power	Ground of booster (VSS2) and LCD (VSS4) driver. Ground system should be connected together by FPC or PCB.															
VSSX	Power	Ground of OSC circuit. Ground system should be connected together by FPC or PCB.															
VD1S	Input	Digital power source selection. VD1S = "L": the power source of digital circuit is VDD1. VD1S = "H": the power source of digital circuit is internal regulator.															
		<table border="1"> <thead> <tr> <th>VDD1 (TYP.)</th> <th>Cap. of VD1 and VSS</th> <th>Level of VD1S</th> </tr> </thead> <tbody> <tr> <td>1.8</td> <td>Unnecessary</td> <td>VSS1</td> </tr> <tr> <td>2.8</td> <td>Necessary</td> <td>VDD1</td> </tr> <tr> <td>3.0</td> <td>Necessary</td> <td>VDD1</td> </tr> <tr> <td>3.3</td> <td>Necessary</td> <td>VDD1</td> </tr> </tbody> </table>	VDD1 (TYP.) 		1.8	Unnecessary	VSS1													
		2.8	Necessary	VDD1													
3.0	Necessary	VDD1															
3.3	Necessary	VDD1															
VD1I VD1O	Power	VD1I is the power source of digital circuits. VD1O is the VD1 output. VD1I and VD1O should be connected together by FPC or PCB.															
V0O V0I V0S	Power Power Input	Positive operating voltage of COM-drivers. V0O is the output of the positive Vop generator. V0I is the positive Vop supply of LCD drivers. V0S is the sensor of the positive Vop generator. V0O, V0I & V0S should be separated on ITO and be connected together by FPC.															
XV0O XV0I XV0S	Power Power Input	Negative operating voltage of COM-drivers. XV0O is the output of the negative Vop generator. XV0I is the negative Vop supply of LCD drivers. XV0S is the sensor of the negative Vop generator. XV0O, XV0I & XV0S should be separated on ITO and be connected together by FPC.															
VGO VGI VGS VM	Power Power Input Power	VG is the power of SEG-drivers. VM is the non-select voltage level of COM-drivers. VGO is the output of the VG regulator. VGI is the supply of SEG-drivers. VGS is the sensor of the VG regulator. VGO, VGI & VGS should be separated on ITO and be connected together by FPC. Be sure the relationships (as shown below) among the LCD driving voltages: $V0 \geq VG \geq VM \geq VSS \geq XV0$; $VDDA-0.7 \geq VM \geq 0.9V$; and $2 \cdot VDDA-0.7 \geq VG \geq 1.8V$ When this IC is operating, VG and VM are generated according to the bias setting shown below: <table border="1"> <thead> <tr> <th>LCD Bias</th> <th>VG</th> <th>VM</th> </tr> </thead> <tbody> <tr> <td>1/N Bias</td> <td>(2/N) x V0</td> <td>(1/N) x V0</td> </tr> </tbody> </table>	LCD Bias	VG	VM	1/N Bias	(2/N) x V0	(1/N) x V0

FUNCTION DESCRIPTION

Microprocessor Interface

Chip Select Input

CSB pin is used for chip selection. ST7586S can interface with an MPU when CSB is "L". If CSB is "H", the inputs of A0, ERD and RWR with any combination will be ignored and D[7:0] are high impedance. In 3-Line and 4-Line serial interfaces, the internal shift register and serial counter are reset when CSB is "H".

Interface Selection

The interface selection is controlled by IF[3..1] pins. Please refer to the table below:

Table 1

Setting			MPU Type	Interface Pin Function				
IF3	IF2	IF1		CSB	A0	RWR	ERD	D[7:0]
H	H	L	Parallel 8080 series MPU	CSB	A0	/WR	/RD	D[7:0]
H	L	L	Parallel 6800 series MPU			R/W	E	
L	H	H	Serial 4-Line series MPU		SCL	--	--	D1=A0; D0=SDA. D[7:2] are not used.
L	H	L	Serial 3-Line series MPU			--	--	D0=SDA. D[7:1] are not used.

Note: The un-used pins are marked as "--" and should be fixed to "H" by "VDD1".

Parallel Interface

When parallel interface is selected, the interface transmission type will be determined by the combination of the control signals. Please refer to the table below:

Table 2

8080 series MPU		6800 series MPU		A0	CSB	Interface Transmission Type
/WR	/RD	R/W	E			
↑	H	L	↓	L	L	Write Command
↑	H	L	↓	H		Write Display Data or Parameter
H	↓	H	↑	H		Read Display Data or Parameter Start
H	↑	H	↓	H		Read Display Data or Parameter Stop

Note: Reading Display Data or Parameter is specified by the instruction before the read operation.

Serial Interface

In serial interface mode (4-Line or 3-Line), IC is active when CSB is "L". Control signals (SDA, SCL and A0 for 4-Line) are enabled when CSB is "L". When CSB is "H", the MPU interface is not active and the internal shift register and counter are reset. It is recommended to set CSB to "H" after each byte transmission.

In 4-Line serial interface, A0 signal is latched at the 8th rising edge of the SCL signal (refer to Fig. 1).

Fig. 1 Write-Operation of 4-Line Serial Interface

In 3-Line interface, A0 signal is not available and the 1st output of SDA will be treated as A0 flag (refer to Fig. 2).

Fig. 2 Write-Operation of 4-Line Serial Interface

Display Data RAM (DDRAM)

ST7586S containing a 384x160x2 bit static RAM stores the display data. The display data RAM (DDRAM) stores the pixel data of the LCD. The built-in DDRAM is an addressable memory array with 384 columns by 160 rows. ST7586S provides two kinds of display modes (monochrome mode and 4-level gray scale mode) and a fast-addressing mode for fast updating display data. Each column address represents 3 sub-columns. For example, setting the column address to "01h" means that upcoming 8 bits data is addressing to column 3; column 4 and column 5 respectively (refer to Fig. 3 and Fig. 4). The display data which is written by MCU will be stored in DDRAM with the format of D7 at the left and D0 at the right when MX=0 (refer to Fig. 3 and Fig. 4). The row address is directly related to the row output number. The LCD controller reads the pixel data in DDRAM, and then it outputs to COM/SEG pad. While the LCD controller operates independently, display data can be written into DDRAM at the same time and data is also being displayed on LCD panel without causing the abnormal display.

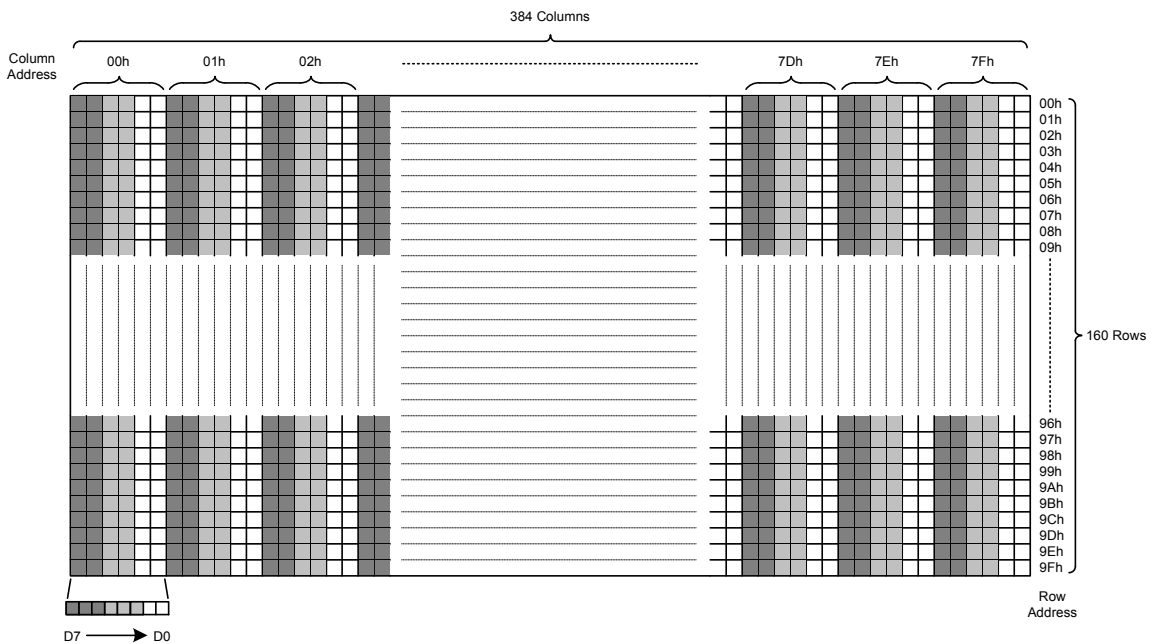

Fig. 5 DDRAM Format

Addressing

In order to allow MCU accessing display data continuously, the address counter is automatically increasing by one (+1) after accessing each byte of display data (i.e. "White Display Data" in all interface or "Read Display Data" in parallel interface). The locations of RAM are addressed by the address pointers (XS, XE, YS and YE). The address ranges are X=0~127 (column address) and Y=0~159 (row address). Addresses outside these range is not allowed.

Before writing to DDRAM, a "window" must be defined for the incoming display data. By specifying the address pointers XS, XE, YS and YE, a "window" is established. The instruction registers XS and YS identify the start addresses while XE and YE identifying the end addresses. For example, the whole display range will be written via the following values to define 384x160: XS=0 (00h), YS=0 (00h) and XE=127 (7Fh), YE=159 (9Fh).

Column Address Circuit

The column address of DDRAM is specified by the "Set Column Address" instruction. Each column address includes three sub-columns Column N, Column N+1 and Column N+2 respectively ("N" is the column address value). The column address counter is increased by one (+1) after each byte of display data accessed (write/read). The starting column address is defined by XS and the ending column address is defined by XE. The column address counter will be returned to the starting column address (XS) immediately if the increment of the column address exceeds the boundary column address (XE).

Row Address Circuit

The circuit provides the row address of DDRAM. The row address is increased by one (+1) after the column address counter is over XE. The row address will be returned to starting row address (YS) immediately when the row address is increased by one over the ending row address (YE).

LCD Display Function DDRAM Map to LCD Driver Output

The internal relation between DDRAM and LCD driver circuit (SEG/COM output path) with different MX or MY setting is illustrated below.

Fig. 6 DDRAM Display Direction

Line Address Circuit

This circuit assigns DDRAM a Line Address corresponding to the first line (setting by instruction of First Output COM) of display. Therefore, by setting Line Address repeatedly, ST7586S is possible to realize the screen scrolling without changing the content of DDRAM as shown in Fig. 7.

Fig. 7 Display Data RAM Map (1/160 Duty)

Partial Display

This function is defining the visible display area as illustrated in Fig. 8. The different partial display area setting will be changing frame rate or Vop to avoid abnormal display. The recommended range of partial display area setting is defined from 64 duty to 160 duty. The partial display setting is combining the instructions of Partial Display and Partial Display Area.

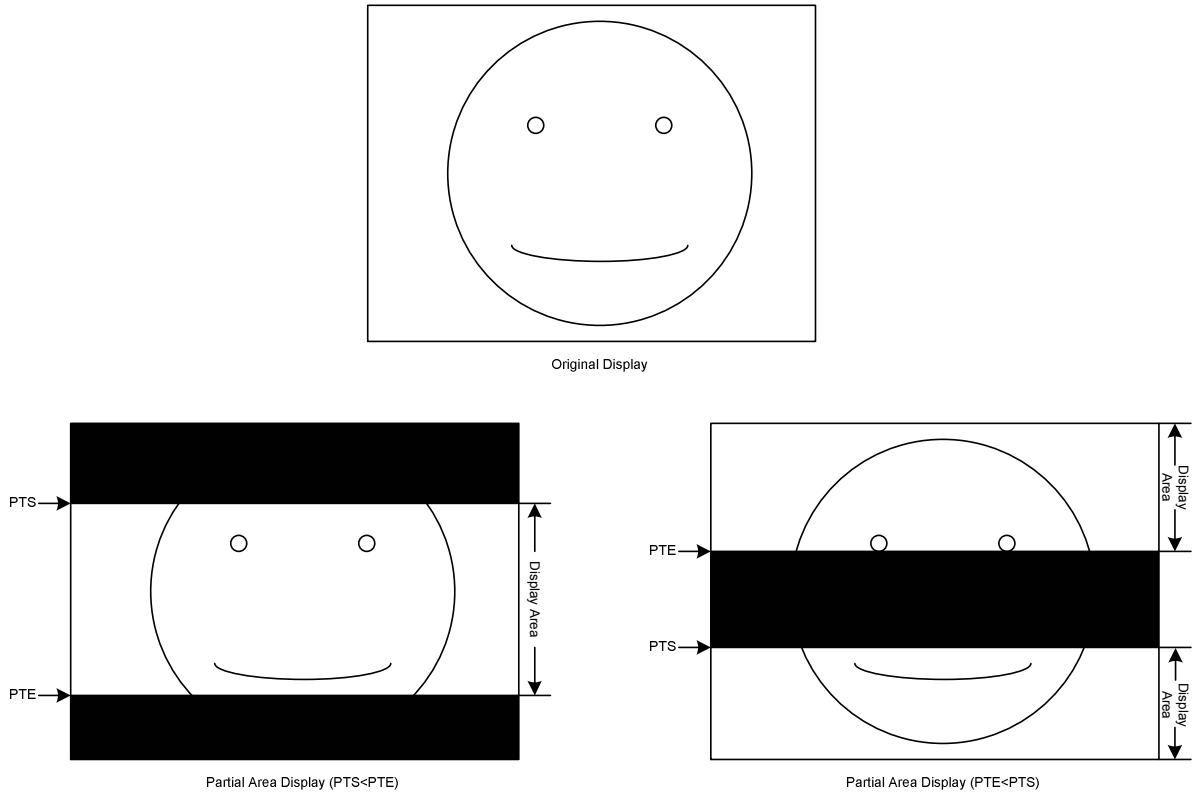

Fig. 8 Partial Display Definition

Rolling Scroll

This function is determined by the instructions of Scroll Area and Start Line. TA, SA and BA meaning Top Area, Scrolling Area and Bottom Area respectively. The instruction of Scroll Area setting must correspond to $TA+SA+BA=160$. Depending on the Scroll Area setting, the setting range of Start Line must correspond to $TA \leq S[7..0] < (TA+SA)$.

Liquid Crystal Driver Power Circuit

The built-in power circuits generate the voltage levels which are necessary to drive the liquid crystal. It consumes low power with the fewest external component. The built-in power system has voltage booster, voltage regulator and voltage follower circuits. Before power ST7586S is OFF, a Power OFF procedure is needed. Please refer to the OPERATION FLOW section.

External Component of Power Circuit

The recommended external power components need only three capacitors. The detailed values of these three capacitors are determined by panel size and loading.

Temperature Gradient Selection Circuit

SET V0 with temperature compensation (Temperature ≠ 24°C)

There are 16-line slopes in each temperature step, and customer can select one line slope of temperature compensation coefficient for each temperature step. Each temperature step is 8°C. Please see Fig. 11 as below.

Fig. 11 Temperature Compensation Coefficient Selection

In instruction Temperature Gradient Compensation each parameter MTx, where x=0, 1, 2,..., E, F has a setting value between 0 and 15. MTx=0 results in Mx=0V increment on V0, MTx=1 results in Mx=5mV increment,..., MTx=15 results in Mx=15x5mV=75mV increment. Note that each MTx individually corresponds to a temperature interval; the Mx means temperature gradient slope coefficient. The relations between Mx and V0 quantity due to temperature V0(T) are described in the equation shown in Table 3.

Temperature Range	Equation V0(T) at temperature=T°C

Note:

- Please make sure to avoid any kind of heating source near ST7586S such as back light, to prevent V_{op} is not anticipative because of temperature compensation circuit is working.

Frequency Temperature Gradient Compensation Coefficient Register Loading Detection

ST7586S will auto-switch frame rate in different temperature such as Fig. 13. TA, TB and TC are frame rate switching temperature which can be defined by customer with instruction Temperature Range. FRA, FRB, FRC and FRD are switched frame rate which also can be defined by customer with instruction Frame Rate. The frame rate range is from 18.75Hz to 170Hz.

RESET CIRCUIT

Setting RSTB pin to “L” (hardware reset) or instruction RESET (software reset) can initialize internal function. Please note the hardware reset is not same as the software reset. Generally, VDD1 is not stable at the time that the system power is just turned ON. The hardware reset is required to initialize internal registers after VDD1 is stable. Initialization by RSTB pin is essential before operating. The default values of registers are listed below:

INSTRUCTION DESCRIPTION

NOP

“No Operation” instruction. ST7586S will do nothing when receiving this instruction.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	0	0	0	0	0	0	No operation

RESET

When this instruction is issued, the software reset procedure is started. This instruction resets the software reset default value and keeps the DDRAM content.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	0	0	0	0	0	1	Software reset

Power Save

When ST7586S enters the sleep in mode, the mode causes the LCD module entering the minimum power consumption mode. All of operations (e.g. the DC/DC converter, internal oscillator and panel scanning) are stopped.

When ST7586S enters sleep out mode (exit sleep in mode), the DC/DC converter and internal oscillator are started.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	0	1	0	0	0	SLP	SLP=0: Sleep in mode SLP=1: Sleep out mode

Partial Mode

When ST7586S enters the partial display mode, the partial area is described by Partial Display Area instruction. The different partial display area setting will be changing frame rate or Vop to avoid abnormal display.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	0	1	0	0	1	PTL	PTL=0: Partial mode on PTL=1: Partial mode off

Inverse Display

This instruction would inverse the scanned data without recover the content of DDRAM. As the result, the ON and OFF status of all pixels are interchanged.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	1	0	0	0	0	INV	INV=0: Normal display INV=1: Inverse display

All Pixel ON/OFF

When ST7586S enters all pixels on or off mode, all display pixels are turned on or off regardless of the content of DDRAM. The content of DDRAM is not changed by setting All Pixel ON/OFF. After execute the instruction of Partial Mode, the display mode will exit all pixel on/off mode then enter normal mode.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	1	0	0	0	1	AP	AP=0: All pixel off mode AP=1: All pixel on mode

Display ON/OFF

This instruction turns the display ON or OFF. When ST7586S enters display off, the display output is blank regardless of the content of DDRAM. When ST7586S enters display on (exit display off), the display output is according to content of DDRAM.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	1	0	1	0	0	DSP	DSP=0: Display off DSP=1: Display on

Set Column Address

This instruction is used to define area of DDRAM where MCU can access. The column address is automatically increased by one (+1) after each DDRAM access. After the ending column address XE[15..0], column address returns to starting column address XS[15..0]. The XS[15..0] setting that must be equal to or less than XE[15..0]. When XS[15..0] or XE[15..0] is great than 7Fh, out of DDRAM range will be ignored.

Set Row Address

This instruction is used to define area of DDRAM where MCU can access. The row address is automatically increased by one (+1) after column address counter is over XE[15..0]. The row address will return to starting row address YS[15..0] immediately when the row address increases one over the ending row address YE[15..0]. The YS[15..0] setting must be equal to or less than YE[15..0]. When YS[15..0] or YE[15..0] is great than 9Fh, out of DDRAM range will be ignored.

Write Display Data

This instruction is used to transfer data from MCU to DDRAM without changing status of ST7586S. The column address and row address will be reset to starting column address (XS) and starting row address (YS) when this instruction is accepted. The pre-instruction is defined to enter write DDRAM mode. The following continuously data means content of DDRAM without pre-instruction. Write Display Data would be stopped when any other instruction is accepted.

Read Display Data

The instruction is used to transfer data from DDRAM to MCU without changing status of ST7586S. The column address and row address will be reset to starting column address (XS) and starting row address (YS) when this instruction is accepted. The pre-instruction is defined to enter read DDRAM mode. The following continuously data means content of DDRAM without pre-instruction. Read Display Data would be stopped when any other instruction is accepted. Read Display Data is only available via the parallel interface.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	0	0	1	0	1	1	1	0	Read display data from DDRAM
1	1	D7	D6	D5	D4	D3	D2	D1	D0	

Partial Display Area

This instruction defines the display area of partial mode. There are four parameters associated with this instruction, the Partial Display Address Start PTS[15..0] and the Partial Display Address End as illustrated in Fig. 8. The instruction of Partial Display must be executed before setting the instruction of Partial Display Area

0	0	0	0	1	1	1	0	1	0	Enable DDRAM interface
1	0	0	0	0	0	0	0	1	0	

Display Duty

This instruction defines display duty. The parameter setting of Display Duty is the number of physical display duty decreasing by one (-1). For example, the parameter must set 9Fh when the LCD display duty is 160.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	0	1	1	0	0	0	0	DT=03h~9Fh
1	0	DT7	DT6	DT5	DT4	DT3	DT2	DT1	DT0	

First Output COM

This instruction defines the first output COM number that mapping to the Start Line of DDRAM. For example, the parameter of First Output COM setting is 08h and the parameter of Start Line setting is 02h means that the COM8 would output the DDRAM data at row address 2.

Partial Display

This instruction is used to set the partial display. The instruction of Partial Display must be executed before setting the instruction of Partial Display Area.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	0	1	1	0	1	0	0	Set partial display mode
1	0	1	0	1	0	0	0	0	0	

N-Line Inversion

This instruction is used to set the frame inverted number with range of 2 to 31.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description

Read Modify Write

This instruction is used to enter/exit read modify write mode. When entering read modify write, the display data read will not increase column address. Only the display data write operation will increase the column address. This mode is maintained until Disable Read Modify Write (B9h) is accepted.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	0	1	1	1	0	0	RMW	RMW=0: Enable read modify write RMW=1: Disable read modify write

Set Vop

This instruction is used to adjust the optimum LCD supply voltage Vop.

The calculation of Vop is as shown below: $V0 = 3.6 + (Vop[8:0] + VOF[6:0] + VopIncStep - VopDecStep) \times 0.04$

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description

Vop Increase

This instruction is used to increase Vop step by one

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	0	0	0	0	0	1	Vop increase one step

Vop Decrease

This instruction is used to decrease Vop step by one

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	0	0	0	0	1	0	Vop decrease one step

BIAS System

This instruction is used to select LCD bias ratio of the voltage to meet the requirement of driving the LCD.

Analog Control

This instruction is used to set status of analog circuit.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	0	1	0	0	0	0	Enable analog circuit
1	0	0	0	0	1	1	1	0	1	

Auto Read Control

This instruction is used to set status of OTP auto read to enable or disable.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	0	1	0	1	1	1	XARD=0: Enable auto read
1	0	1	0	0	XARD	1	1	1	1	XARD=1: Disable auto read

OTP WR/RD Control

This instruction is used to set status of OTP that write to OTP or read from OTP.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	1	0	0	0	0	0	WR/RD=0: Enable OTP read
1	0	0	0	WR /RD	0	0	0	0	0	WR/RD=1: Enable OTP write

OTP Control Out

This instruction is used to cancel the OTP control.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	1	0	0	0	0	1	OTP control out

OTP Write

This instruction is used to trigger OTP programming procedure.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	1	0	0	0	1	0	OTP programming procedure

OTP Read

This instruction is used to trigger OTP up-load procedure.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	1	0	0	0	1	1	OTP up-load procedure

OTP Selection Control

This instruction is used to define OTP selection control.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	1	0	0	1	0	0	Ctrl=0: Disable OTP
1	0	0	Ctrl	0	1	1	0	0	1	Ctrl=1: Enable OTP

OTP Programming Setting

This instruction is used to set OTP write timing.

A0	R/W	D7	D6	D5	D4	D3	D2	D1	D0	Description
0	0	1	1	1	0	0	1	0	1	OTP programming setting
1	0	0	0	0	0	1	1	1	1

HANDLING

Inputs and outputs are protected against electrostatic discharge in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling MOS devices.

Note:

1. All voltages are respect to VSS unless otherwise noted (VSS=VSS1=VSS2=VSS4=VSSX).
2. Stresses exceed the ranges listed above may cause permanent damage to IC.
3. Parameters are valid over operating temperature range unless otherwise specified.
4. Insure the voltage levels of V0, VG, VM, VSS and XV0 always match the correct relation:
 $V0 \geq VG > VM > VSS \geq XV0$

ST7586S

- **For VPP**

This is the power source for programming the internal OTP. If the ITO resistance is too high, the operation current will cause the voltage drop while programming OTP. Please try to keep the ITO resistance as low as possible.

- **Enhance ESD performance for COG application**

1. Increase RSTB resistance:

Fig. 19 RSTB ITO Layout

2. Add ESD protection ring:

Selection of Liquid Crystal

Referential LCD Module Setting

VDD1=2.8V, VDD2=VDD3=VDD4=VDD5=VDDX=2.8V, Panel Size=4.0", Booster Level=X8, N-Line=Frame Inversion

Display Mode	Recommended Parameter of Liquid Crystal		
	Duty	BIAS	Vop Range
4-Level Gray Scale	80	1/9	9.0 ~ 12.3
		1/10	11.5 ~ 13.5
	160	1/10	11.5 ~ 13.5
		1/11	12.5 ~ 13.5
Monochrome	80	1/9	9.0 ~ 14.0
		1/10	11.5 ~ 14.0
	160	1/10	11.5 ~ 14.0
		1/11	12.5 ~ 14.0

● In different range of partial area, the Vop and BIAS setting must within the Recommended Parameter of Liquid Crystal after consider the temperature effect and user adjustment.

Note:

- Positive Booster: $(VDD2 \times BL \times BE) \geq V0$ or $(VDD2 \times BL \times BE) \geq Vop$
- Negative Booster: $[-VDD2 \times (BL - 1) \times BE] \leq XV0$ or $[VDD2 \times (BL - 1) \times BE] \leq (Vop - VG)$, where $VG = Vop \times 2 / N$
- Vop requirement:
 $VDD2 \times (BL - 1) \times BE \geq Vop \times (N - 2) / N$ or $Vop \leq VDD2 \times (BL - 1) \times BE \times N / (N - 2)$, where N is bias rate.
- BL is the booster level and BE is the booster efficiency.
Referential value are listed below: (assume VDD2~VDD5=2.8V and BL=X8)
Module Size = 3.0"~4.0": BE=70% (Typical)
Actual BE should be determined by module loading and ITO resistance value.
- $1.6V \leq VG < 2 \times VDD2$.
Recommend VG is: VDD2-VG around 0.3~0.5V.
- $VM=VG/2$ and $0.8V \leq VM < VDD2$
- The ITO resistance restriction of LCD module please refers to the table of ITO Resistance Limitation.

REVERSION HISTORY

Version	Date	Description
0.1	2009/06/29	<ul style="list-style-type: none"> ● Redraw figures. ● Fix naming issue. ● Fix font error.
