

## +5 V, +5 V and +8 V triple voltage regulator with disable and reset functions

### Features

- Input voltage range between 7 V and 18 V
- Output currents up to 600 mA
- Fixed precision output 1 voltage of  $5\text{ V} \pm 2\%$
- Fixed precision output 2 voltage of  $5\text{ V} \pm 2\%$
- Fixed precision output 3 voltage of  $8\text{ V} \pm 2\%$
- Output 1 with reset facility
- Outputs 2 and 3 can be disabled by digital input
- Short circuit protection on each output
- Thermal protection
- Low dropout voltages

### Description

The STV8162 and STV8162D are monolithic triple positive voltage regulators designed to provide three fixed precision output voltages of 5 V, 5 V and 8 V for currents up to 0.6 A.

An internal reset circuit generates a reset pulse when the voltage of output 1 drops below the regulated voltage value.

Outputs 2 and 3 can be disabled by a digital input.

Short-circuit and thermal protections are included in all versions.

### 3 Circuit description

The STV8162 and STV8162D are triple-voltage regulators with reset and disable functions.

The three regulation parts are supplied from a single voltage reference circuit trimmed by zener zapping during EWS testing. Since the supply voltage of this voltage reference is connected to pin INPUT1 ( $V_{IN1}$ ), the second and third regulators will not work if pin INPUT1 is not supplied.

The output stages are designed using a Darlington configuration with a typical dropout voltage of 1.0 V.

In all applications, all three inputs must be polarized. If outputs 2 or 3 are not used, the corresponding inputs must be connected to Input 1.

The disable circuit will switch off pins OUTPUT2 and OUTPUT3 if a voltage less than 0.8 V is applied to pin  $\overline{\text{DISABLE}}$ .

The reset circuit checks the voltage at pin OUTPUT1. If this voltage drops below  $V_{OUT1}-0.25$  V (4.75 V Typ.), the "a" comparator (*Figure 4*) rapidly discharges the external capacitor ( $C_e$ ) and the reset output immediately switches to low. When the voltage at pin OUTPUT1 exceeds  $V_{OUT1}-0.175$  V (4.825 V Typ.), the  $V_{C_e}$  voltage increases linearly to the reference voltage ( $V_{REF} = 2.5$  V) corresponding to a reset pulse delay ( $t_{RD}$ ) as shown in *Figure 5*.

$$t_{RD} = \frac{C_e \times 2.5V}{10\mu A}$$

Afterwards, the reset output returns to high. To avoid glitches in the reset output, the second comparator "b" has a large hysteresis (1.9 V).

## 5 Power dissipation and layout indications

The power is mainly dissipated by the three device buffers. It can be calculated by the equation:

$$P = (V_{IN1} - V_{OUT1}) \times I_{OUT1} + (V_{IN2} - V_{OUT2}) \times I_{OUT2} + (V_{IN3} - V_{OUT3}) \times I_{OUT3}$$

The following table lists the different  $R_{thJA}$  values of these packages with or without a heat sink and the corresponding maximum power dissipation assuming:

- Maximum ambient temperature = 70° C
- Maximum junction temperature = 140° C

**Table 5. Power dissipation**

Device	Heat Sink	$R_{thJA}$ in °C/W	$P_{MAX}$ in W
STV8162	No	50	1.4
	Yes	15	4.6
STV8162D	No	56 to 40	1.25 to 1.75
	Yes	32	2.2

## 6.1 Environmentally-friendly packages

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK® packages, depending on their level of environmental compliance.

ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

## 7 Revision history
