

## Voltage Detector

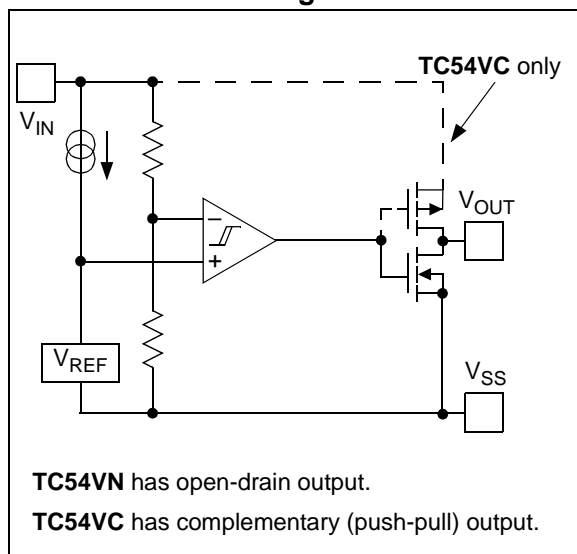

### Features

- $\pm 2.0\%$  Detection Thresholds
- Small Packages: 3-Pin SOT-23A, SOT-89, and TO-92
- Low Current Drain:  $1\ \mu\text{A}$ , typical
- Wide Detection Range: 1.1V to 6.0V
- Wide Operating Voltage Range: 0.7V to 10V

### Applications

- Battery Voltage Monitoring
- Microprocessor Reset
- System Brown-Out Protection
- Switching Circuit in Battery Backup
- Level Discriminator

### Functional Block Diagram

### General Description

The TC54 series are CMOS voltage detectors that are especially well suited for battery-powered applications because of their extremely low  $1\ \mu\text{A}$  operating current and small surface-mount packaging. Each part is laser-trimmed to the desired threshold voltage, which can be specified from 1.4V to 6.0V with a 2% tolerance.

The TC54 is available with either an open-drain or complementary output stage. During operation, the output ( $V_{OUT}$ ) remains in the logic-high state as long as  $V_{IN}$  is greater than the specified threshold voltage ( $V_{DET-}$ ). When  $V_{IN}$  falls below  $V_{DET-}$ , the output is driven to a logic-low.  $V_{OUT}$  remains low until  $V_{IN}$  rises above  $V_{DET-}$  by an amount  $V_{HYST}$ , when it resets to a logic-high state.

### Package Types

### Device Features

Device	Output		Reset Delay	Std. Trip Points <sup>(1)</sup> (typical)
	Type	State		
TC54VN	Open-Drain	Active Low	No	1.4V, 2.1V, 2.7V, 2.9V
TC54VC	Push-Pull	Active Low	No	3.0V, 4.2V, 4.3V

**Note 1:** Custom Trip Points available. Minimum order requirement. Information available upon request.

# TC54

## 1.0 ELECTRICAL CHARACTERISTICS

### Absolute Maximum Ratings †

Input Voltage .....	+12V
Output Current .....	50 mA
Output Voltage: CMOS.....	(V <sub>SS</sub> - 0.3V) to (V <sub>IN</sub> + 0.3V)
Open-Drain.....	(V <sub>SS</sub> - 0.3V) to 12V
Power Dissipation (T <sub>A</sub> ≤ 70°C):	
3-Pin SOT-23A .....	240 mW
3-Pin SOT-89.....	500 mW
3-Pin TO-92.....	300 mW
Operating Temperature Range.....	-40°C to +85°C
Storage Temperature Range.....	-65°C to +150°C

† **Notice:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions above those indicated in the operation sections of the specifications is not implied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability.

### DC CHARACTERISTICS

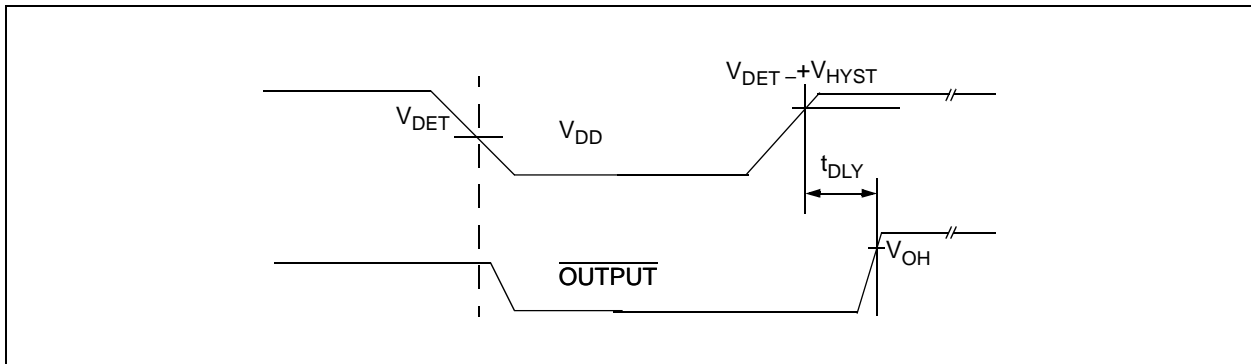

Electrical Specifications: Unless otherwise noted, T <sub>A</sub> = +25°C.						
Parameter	Sym	Min	Typ	Max	Units	Test Conditions

## 2.0 PIN DESCRIPTIONS

The descriptions of the pins are listed in [Table 2-1](#).

**TABLE 2-1: PIN FUNCTION TABLE**

TC54			Symbol	Description
SOT-23A	SOT-89	TO-92		
1	1	1	$V_{OUT}$	Digital Output
3	2	2	$V_{IN}$	Analog Input
2	3	3	$V_{SS}$	Ground Terminal
—	Tab	—	$V_{IN}$	Analog Input

### 2.1 Digital Output ( $V_{OUT}$ )

$V_{OUT}$  goes low when  $V_{IN}$  drops below  $V_{DET-}$  and returns high when  $V_{IN}$  rises above  $V_{DET-} + V_{HYST}$ . (See [Figure 3-1](#)).

### 2.2 Analog Input ( $V_{IN}$ )

$V_{IN}$  can be used for power supply monitoring or a voltage level that requires monitoring.

### 2.3 Ground Terminal ( $V_{SS}$ )

$V_{SS}$  provides the negative reference for the analog input voltage. Typically, the circuit ground is used.

## 3.0 DETAILED DESCRIPTION

In normal steady-state operation when  $V_{IN} > V_{DET-}$ , the output will be at a logic-high (see Figure 3-1). In the case of the TC54VN, this is an open-drain condition. If the input falls below  $V_{DET-}$ , the output will pull down (Logic 0) to  $V_{SS}$ . Generally,  $V_{OUT}$  can pull down to within 0.5V of  $V_{SS}$  at rated output current and input voltage. (See Section 1.0 “Electrical Characteristics”).

The output ( $V_{OUT}$ ) will stay valid until the input voltage falls below the minimum operating voltage ( $V_{INMIN}$ ) of 0.7V. Below this minimum operating voltage, the output is undefined. During power-up (or anytime  $V_{IN}$  has fallen below  $V_{INMIN}$ ),  $V_{OUT}$  will remain undefined until  $V_{IN}$  rises above  $V_{INMIN}$ . When this occurs, the output will become valid.  $V_{OUT}$  will be in its Active-low state, while  $V_{INMIN} < V_{IN} < V_{DET+}$  (therefore,  $V_{DET+} = V_{DET-} + V_{HYST}$ ). If the input rises above  $V_{DET+}$ , the output will assume its Inactive state (high for TC54VC, open-drain for TC54VN).

**FIGURE 3-1:** Timing Diagram.

## 4.0 APPLICATIONS INFORMATION

### 4.1 Modifying the Trip Point, $V_{DET-}$

Although the TC54 has a pre-programmed  $V_{DET-}$ , it is sometimes necessary to make adjustments during prototyping. This can be accomplished by connecting an external resistor divider to a TC54, which has a  $V_{DET-}$  lower than that of  $V_{SOURCE}$  (Figure 4-1).

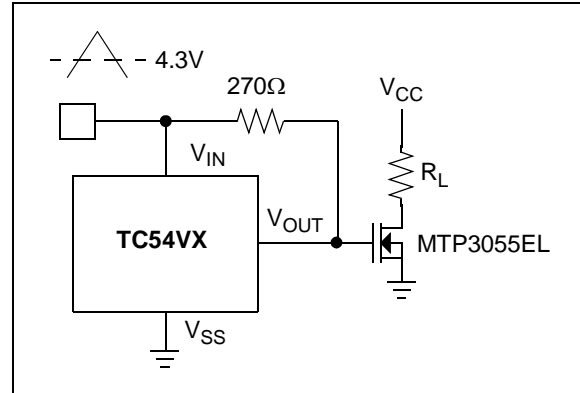

To maintain detector accuracy, the bleeder current through the divider should be significantly higher than the 1  $\mu$ A operating current required by the TC54. A reasonable value for this bleeder current is 100  $\mu$ A (100 times the 1  $\mu$ A required by the TC54). For example, if  $V_{DET-} = 2V$  and the desired trip point is 2.5V, the value of  $R_1 + R_2$  is 25 k $\Omega$  (2.5V/100  $\mu$ A). The value of  $R_1 + R_2$  can be rounded to the nearest standard value and plugged into the equation of Figure 4-1 to calculate values for  $R_1$  and  $R_2$ . 1% tolerance resistors are recommended.

**FIGURE 4-1:** Modify Trip-Point of the TC54 using External Resistor Divider.

### 4.2 Other Applications

Low operating power and small physical size make the TC54 series ideal for many voltage detector applications, such as those shown in Figures 4-2, 4-3 and 4-4. Figure 4-2 shows a low-voltage gate drive protection circuit that prevents the overheating of the logic-level MOSFET due to insufficient gate voltage. When the input signal is below the threshold of the TC54VN, its output grounds the gate of the MOSFET. Figures 4-3 and 4-4 show the TC54 in conventional voltage monitoring applications.

**FIGURE 4-2:** MOSFET Low Drive Protection.

**FIGURE 4-3:** Battery Voltage Monitor.

**FIGURE 4-4:** Power Good Monitor.

## 5.0 PACKAGING INFORMATION

### 5.1 Package Marking Information

3-Lead SOT-23A

Example

3-Lead SOT-89

Example

3-Lead TO-92

Example

<b>Legend:</b>	XX...X	Customer-specific information
	Y	Year code (last digit of calendar year)
	YY	Year code (last 2 digits of calendar year)
	WW	Week code (week of January 1 is week '01')
	NNN	Alphanumeric traceability code
	(e3)	Pb-free JEDEC designator for Matte Tin (Sn)
	*	This package is Pb-free. The Pb-free JEDEC designator (e3) can be found on the outer packaging for this package.
<b>Note:</b>	In the event the full Microchip part number cannot be marked on one line, it will be carried over to the next line, thus limiting the number of available characters for customer-specific information.

NOTES:

## APPENDIX A: REVISION HISTORY

### Revision J (June 2011)

The following is the list of modifications:

1. Updated temperature values in [Temperature Specifications](#) table.
2. Corrected equation in [Figure 4-1](#).
3. Added new examples layout in [Section 5.1, Package Marking Information](#).

### Revision H (December 2007)

The following is the list of modifications:

1. Updated Features section.
2. Removed 5-Pin SOT-23 related information.
3. Updated Output Current ( $I_{OUT}$ ) Electrical Specification.
4. Removed 7.7V (typical) Voltage Trip Point Option. Max Trip Point Voltage is now 6.0V.
5. Updated Pin Function Table.
6. Updated Packaging Specification Information.
7. Added Revision History section.
8. Updated Product Identification System page.

### Revision G (August 2004)

Undocumented changes.

### Revision F (July 2004)

Undocumented changes.

### Revision E (April 2003)

Undocumented changes.

### Revision D (October 2002)

Undocumented changes.

### Revision C (July 2002)

Undocumented changes.

### Revision B (May 2002)

Undocumented changes.

### Revision A (March 2001)

Original Release of this Document.

# TC54

NOTES:

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
