Characteristics

Remark:

The reference level for the relative attenuation a_{rel} of the TFS 77A is the minimum of the pass band attenuation a_{min} . The minimum of the pass band attenuation a_{min} is defined as the insertion loss a_e . The centre frequency f_C is the arithmetic mean value of the upper and lower frequencies at the 1 dB filter attenuation level relative to the insertion loss a_e . The nominal frequency f_N is fixed at 77,55 MHz without any tolerance. The given values for the relative attenuation a_{rel} have to be achieved at the frequencies given below even if the centre frequency f_C is shifted due to the temperature coefficient of frequency T_C in the operating temperature range and due to a production tolerance for the centre frequency f_C .

^{*)} The terminating impedances depend on parasitics and q-values of matching elements and the board used, and are to be understood as reference values only. Should there be additional questions do not hesitate to ask for an application note or contact our design team.

**) $\Delta f_C(Hz) = TC_f(ppm/K) \times (T - T_o) \times f_{To} (MHz)$.
