GENERAL DESCRIPTION

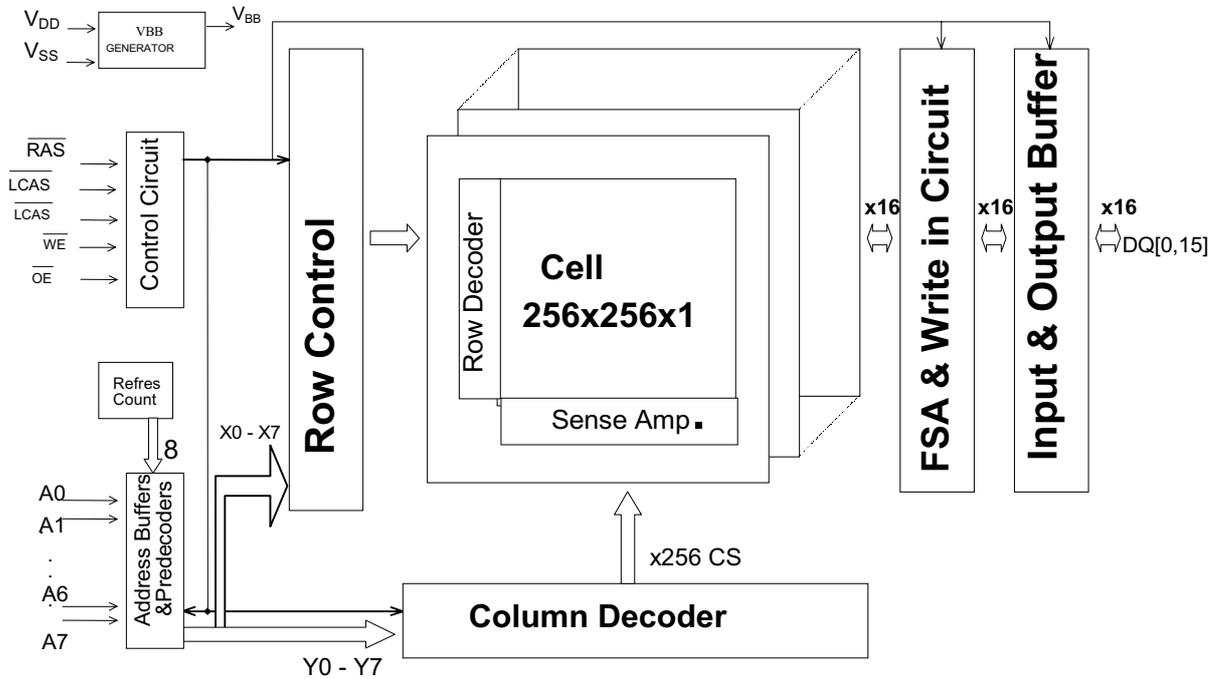

The UT51C161 is high speed 5 Volt EDO DRAMs organized as 64K bit X 16 I/O and fabricated with the CMOS process. The UT51C161 offers a combination of unique features including: EDO Page Mode operation for higher bandwidth with Page Mode cycle time as short as 14ns. All inputs are TTL compatible. Input and output capacitance is significantly lowered to increase performance and minimize loading. These features make the UT51C161 suited for wide variety of high performance computer systems and peripheral applications

Notes:

1. t_{RCD} (Max.) is specified for reference only. Operation within t_{RCD} (Max.) limits insures that t_{RAC} (Max.) and t_{CAA} (Max.) can be met. If t_{RCD} is greater than the specified t_{RCD} (Max.), the access time is controlled by t_{CAA} and t_{CAC} .
2. Either t_{RRH} or t_{RCH} must be satisfied for Read Cycle to occur.
3. Measured with a load equivalent to one TTL input and 50pF.
4. Access time is determined by the longest of t_{CAA} , t_{CAC} and t_{CAP} .
5. Assumes that $t_{RAD} \leq t_{RAD}(\text{Max.})$. If t_{RCD} is greater than $t_{RCD}(\text{Max.})$, t_{RAC} will increase by the amount that t_{RCD} exceeds $t_{RCD}(\text{Max.})$.
6. Assumes that $t_{RCD} \leq t_{RCD}(\text{Max.})$. If t_{RAD} is greater than $t_{RAD}(\text{Max.})$, t_{RAC} will increase by the amount that t_{RAD} exceeds $t_{RAD}(\text{Max.})$.
7. Assumes that $t_{RAD} \geq t_{RAD}(\text{Max.})$.
8. Operation within the $t_{RAD}(\text{Max.})$ limits ensures that t_{RA} can be met. $t_{RAD}(\text{Max.})$ is specified as a reference point only. If t_{RAD} is greater than the specified $t_{RAD}(\text{Max.})$, the access time is controlled by t_{CAA} and t_{CAC} .
9. t_{WCS} , t_{RWD} , t_{AWD} and t_{CWD} are not restrictive operating parameters.
10. $t_{WCS}(\text{min.})$ must be satisfied in an Early Write Cycle.
11. t_{DS} and t_{DH} are referenced to the latter occurrence of $\overline{\text{CAS}}$ or $\overline{\text{WE}}$.
12. t_T is measured between $V_{IH}(\text{min.})$ and $V_{IL}(\text{max.})$. AC-measurements assume $t_T = 3\text{Ns}$.
13. Assumes a tri-state test load (5pF and a 500Ohm Thevenin equivalent).
14. An initial pause of 200us is required after power-up followed by any 8 CBR or ROR cycles before device operation is achieved.
