

**3.3 VOLT 64M x 72 HIGH PERFORMANCE  
UNBUFFERED ECC SDRAM MODULE****Features**

- 168 Pin Unbuffered ECC 67,108,864 x 72 bit Organization SDRAM Modules
- Utilizes High Performance 32M x 8 SDRAM in TSOPII-54 Packages
- Fully PC Board Layout Compatible to INTEL'S Rev 1.0 Module Specification
- Single +3.3V ( $\pm 0.3V$ ) Power Supply
- Programmable CAS Latency, Burst Length, and Wrap Sequence (Sequential & Interleave)
- Auto Refresh (CBR) and Self Refresh
- All Inputs, Outputs are LVTTTL Compatible
- 8192 Refresh Cycles every 64 ms
- Serial Present Detect (SPD)

**Description**

The V437464S24V memory module is organized 67,108,864 x 72 bits in a 168 pin dual in line memory module (DIMM). The 64M x 72 unbuffered DIMM uses 18 Mosel-Vitellic 32M x 8 ECC SDRAM. The x72 modules are ideal for use in high performance computer systems where increased memory density and fast access times are required.

**Notes:**

1. The specified values are valid when addresses are changed no more than once during  $t_{CK}(\text{min.})$  and when No Operation commands are registered on every rising clock edge during  $t_{RC}(\text{min.})$ . Values are shown per module bank.
2. The specified values are valid when data inputs (DQ's) are stable during  $t_{RC}(\text{min.})$ .
3. All AC characteristics are shown for device level.  
An initial pause of 100  $\mu\text{s}$  is required after power-up, then a Precharge All Banks command must be given followed by 8 Auto Refresh (CBR) cycles before the Mode Register Set Operation can begin.
4. AC timing tests have  $V_{IL} = 0.4\text{V}$  and  $V_{IH} = 2.4\text{V}$  with the timing referenced to the 1.4V crossover point. The transition time is measured between  $V_{IH}$  and  $V_{IL}$ . All AC measurements assume  $t_T = 1\text{ ns}$  with the AC output load circuit shown. Specific  $t_{ac}$  and  $t_{oh}$  parameters are measured with a 50 pF only, without any resistive termination and with a input signal of 1V / ns edge rate between 0.8V and 2.0V.

5. If clock rising time is longer than 1 ns, a time  $(t_T/2 - 0.5)$  ns has to be added to this parameter.
6. Rated at 1.5V
7. If  $t_T$  is longer than 1 ns, a time  $(t_T - 1)$  ns has to be added to this parameter.
8. Any time that the refresh Period has been exceeded, a minimum of two Auto (CBR) Refresh commands must be given to "wake-up" the device.
9. Self Refresh Exit is a synchronous operation and begins on the 2nd positive clock edge after CKE returns high. Self Refresh Exit is not complete until a time period equal to  $t_{RC}$  is satisfied once the Self Refresh Exit command is registered.
10. Referenced to the time which the output achieves the open circuit condition, not to output voltage levels.
11.  $t_{DAL}$  is equivalent to  $t_{DPL} + t_{RP}$ .
