Pin Definitions

Pin Name	Pin No.	Pin Type	Pin Description
REF	1	I	***Reference Input:*** The output signals QA0:3 through QB0:3 will be synchronized to this signal unless the device is programmed to bypass the PLL.
QFB	16	O	***Feedback Output:*** This signal is used as the feedback internally to establish the propagation delay of nearly 0.
QA0:3	2, 3, 14, 15	O	***Outputs from Bank A:*** The frequency of the signals provided by these pins is equal to the signal connected to REF.
QB0:3	6, 7, 10, 11	O	***Outputs from Bank B:*** The frequency of the signals provided by these pins is equal to the signal connected to REF.
VDD	4, 13	P	***Power Connections:*** Connect to 3.3V. Use ferrite beads to help reduce noise for optimal jitter performance.
GND	5, 12	P	***Ground Connections:*** Connect all grounds to the common system ground plane.
SEL0:1	9, 8	I	***Function Select Inputs:*** Tie to V_{DD} (HIGH, 1) or GND (LOW, 0) as desired per *Table 1*.

Overview

The W162 products are nine-output zero delay buffers. A Phase-Locked Loop (PLL) is used to take a time-varying signal and provide eight copies of that same signal out.

Internal feedback is used to maximize the number of output signals provided in the 16-pin package.

Spread Aware

Many systems being designed now utilize a technology called Spread Spectrum Frequency Timing Generation. Cypress has been one of the pioneers of SSFTG development, and we designed this product so as not to filter off the Spread Spectrum feature of the Reference input, assuming it exists. When a zero delay buffer is not designed to pass the SS feature through, the result is a significant amount of tracking skew which may cause problems in systems requiring synchronization.

For more details on Spread Spectrum timing technology, please see the Cypress Application note titled, “EMI Suppression Techniques with Spread Spectrum Frequency Timing Generator (SSFTG) ICs.”

Functional Description

Logic inputs provide the user the ability to turn off one or both banks of clocks when not in use, as described in *Table 1*. Disabling a bank of unused outputs will reduce jitter and power consumption, and will also reduce the amount of EMI generated by the W162.

These same inputs allow the user to bypass the PLL entirely if so desired. When this is done, the device no longer acts as a zero delay buffer, it simply reverts to a standard nine-output clock driver.

Absolute Maximum Ratings

Stresses greater than those listed in this table may cause permanent damage to the device. These represent a stress rating only. Operation of the device at these or any other conditions above those specified in the operating sections of this specification is not implied. Maximum conditions for extended periods may affect reliability

t_{LOCK}	PLL Lock Time	Power supply stable			1.0	ms
t_{JC}	Jitter, Cycle-to-Cycle				250	ps

Notes:

1. Long input rise and fall time will degrade skew and jitter performance.
2. All AC specifications are measured with a 50Ω transmission line, load terminated with 50Ω to 1.4V.
3. Skew is measured at V_{DD}/2 on rising edges.
4. Duty cycle is measured at V_{DD}/2
5. For the higher drive -19, the load is 20 pF.
