

WS34063A

DC TO DC CONVERTOR CONTROLLER

The WS34063 Series is a monolithic control circuit containing the primary functions required for DC to DC converters. These devices consist of an internal temperature compensated reference, comparator, controlled duty cycle oscillator with an active current limit circuit, drive and a high current output switch. This series was specifically designed to be incorporated in step-up, step-down and voltage-inverting applications with a minimum number of external components.

FEATURES

- Operation from 3 to 40V input
- Low standby current
- Current limiting
- Output switch current to 1.5A
- Precision 2% reference

8 DIP

8 SOP

PIN:

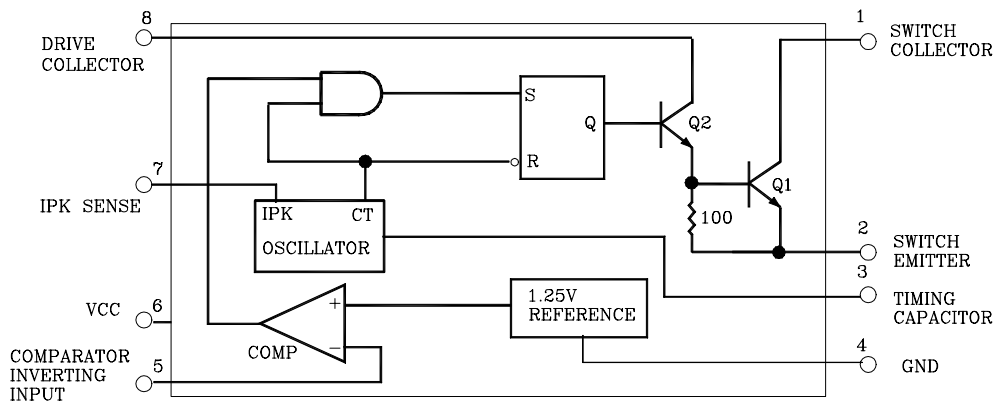

1. Switch Collector
2. Switch Emitter
3. Timing Capacitor
4. GND
5. Comparator Inverting Input
6. VCC
7. IPK Sense
8. Driver Collector

ORDERING INFORMATION

Device	Operating temperature	Package
WS34063 AP	0 ~ +70°C	8 DIP
WS34063 AD	0 ~ +70°C	8 SOP

- Output - voltage adjustable
- Frequency of operation from 100Hz to 100KHz

Notes : 1.Maximum package power dissipation limits must be observed.

2.Low duty cycle pulse techniques are used during test to maintain junction temperature as close to ambient temperature as possible.

TERMS AND DEFINITIONS

- ◆ V_{sat} = Saturation Voltage of the output switch.
- ◆ V_F = Forward Voltage drop of the rectifier.

The following power supply characteristics must be chosen:

- ◆ V_{in} = Normal input voltage
- ◆ V_{out}: Desired Output voltage, $|V_{out}| = 1.25 \left(1 + \frac{R2}{R1}\right)$
- ◆ I_{out} : Desired output current.
- ◆ f_{min} : Minimum desired output switching frequency at the selected values for V_{in} and I_o.
- ◆ V_{ripple}(p-p): Desired peak-to-peak output ripple voltage. in practice, the calculated capacitor value will need to be increased due to its equivalent series resistance and board layout.

The ripple voltage should be kept to a low value since it will directly affect the line and load regulation.
